	2.6	Added guidance relating to ICE classed vessels
28 Nov 05	Rev 1 Introductory Chapter	Editorial corrections

SECTION 1

1.1 History of the SIRE Programme

In 1993, OCIMF established a Ship Inspection Report (SIRE) Programme, which enabled OCIMF members to submit their ship inspection reports to OCIMF for distribution to OCIMF members and certain qualifying non-OCIMF members.

Participation in the original programme, as either an inspecting OCIMF Member or a programme recipient, was strictly voluntary and each programme recipient determined independently how to evaluate the information contained in the reports received from OCIMF.

Under the SIRE Programme, the operator of any ship that is the subject of a report was given a copy of that report and the opportunity to submit written comments relating to the report, to both the inspecting OCIMF Member and to OCIMF.

Report recipients accessed the SIRE System Index by computer and this permitted the index to be viewed or downloaded. Programme recipients could order reports and any matching operator comments from the SIRE system. Reports and comments were transmitted by facsimile to the programme recipients' pre-registered facsimile numbers on request.

1.2 1997 and 2000 Revisions to the Programme

The original SIRE Programme was first revised in 1997 and introduced the means whereby programme recipients were able to receive reports and any operator comments electronically, as well as by facsimile.

Two major changes were also introduced in the 1997 Revised Programme. These were:

1. A Uniform Vessel Inspection Procedure; and,
2. A Vessel Particular Questionnaire (VPQ)¹

The SIRE Programme was again revised in 2000.

This latest 2004 revision makes further important changes to the inspection procedure whilst also adding numerous new vessel types that are inspected under the programme.² Collectively, these are referred to herein as "Vessels"

1.3 Uniform Vessel Inspection Procedure

The programme requires that participating submitting companies follow a uniform **Vessel Inspection Procedure**. This procedure has an **Inspection Element** and a **Report Element**.

1 Under the Original 1993 Programme, the inspecting OCIMF Member was free to choose whatever inspection protocol and report format it desired. In 1997, the Uniform Vessel Inspection Procedure changed this. The Vessel Particular Questionnaire was a newly developed OCIMF document, also introduced in 1997 and was not part of the original programme. The Vessel Inspection Questionnaire was further revised in 2000, and the Vessel Particulars Questionnaire was also revised in 2003 when a Harmonised Vessel Particulars Questionnaire (HVPQ) was introduced.

2 The SIRE Programme is now expanded to include the inspection of barges carrying petroleum products, chemicals, or gas, or vessels used in the carriage of packaged petroleum products or gas, or road tankers carrying the same commodities. Towing vessels that are utilised in the handling of barges carrying the above listed products may also be inspected under the SIRE Programme. The inspection of these vessels and associated questionnaires are addressed in separate questionnaires.

5

The **Inspection Element** uses a series of detailed inspection questionnaires as appropriate for the type of vessel inspected. These questionnaires address issues associated with safety and pollution prevention. Inspectors who are employed, or contracted by submitting companies must (with certain exceptions) answer all these questions.

Questions are, in many cases, accompanied by guidance notes and/or references to source documents. Their purpose is to aid the Inspector's response.

The **Report Element** is developed from the completed electronic questionnaire that is submitted by the Inspector, either directly to the SIRE web site, or to the submitting company for further processing prior to transmission to the vessel operator and to SIRE.

SECTION 2

2.1 The Vessel Inspection Questionnaires, Inspector Manuals and VIQ Computer Programmes

The revisions to the SIRE Vessel Inspection Questionnaires and their accompanying Inspection Reports introduce significant changes to the scope and presentation of the Programme.

These are:

1. The inspection of oil tankers (together with combination carriers and shuttle tankers), chemical carriers and gas carriers. Under the revised Programme, these vessels are categorised by size.
2. The inspection of barges carrying petroleum products, chemicals, or gas, or vessels used in the carriage of packaged petroleum products or gas or road tankers carrying the same commodities, and also towing vessels that are utilised in the handling of barges carrying the above listed products. Collectively, in this document the inspection questionnaires that are used are referred to as "Vessel Inspection Questionnaires" ("VIQs")
3. The key question and sub-question concept used in the 1st and 2nd Editions of the VIQ is discontinued and replaced (except in a few cases) with individual questions. As in the case of previous editions, however, the "Yes" "No", "Not Seen" or "Not Applicable" responses are utilised.

2.2 Inspector Manuals

The Inspector Manual was a new feature introduced with the SIRE revisions in 2000. The Manual reorganised the VIQ key questions, sub-questions and guidance notes to follow the order of the route that would normally be taken by an inspector in the course of an inspection³.

As in the case of the 2nd Edition of the VIQ, Inspector Manuals will be used with this 3rd Edition that set out the questions into the approximate order that an inspector is likely to encounter them during the course of an inspection. However, the "Pro-forma" concept used in the 2nd Edition is discontinued with these latest revisions and a fresh blank complete questionnaire is used for each inspection. Selection of the questionnaire to be used for each particular inspection is made using a "Vessel Selection Wizard" incorporated into the SIRE software programme. This Wizard requires a series of questions to be answered. When the Wizard is completed, the appropriate questionnaire can be printed on a local printer. The questionnaire may be printed in A4 or Letter, or reduced to a size appropriate to be used with the SIRE VIQ pocketbook which is issued to all SIRE-Accredited inspectors. **These Questionnaires must be used during each inspection.** The inspection findings must be transferred from the pocketbook to the appropriate VIQ computer programme after the inspection is completed.

³ Each Inspector Manual is laid out on the assumption that an inspection takes the following course: a review of the vessel's Documentation, followed by an inspection of the Wheelhouse and Navigation, Communications, General external areas (including Mooring, Main Deck and Pumproom), Cargo Control Room, Engine and Steering Compartments and finally, the Accommodation.

SECTION 3

3.1 Using the SIRE Vessel Inspection Questionnaires (“VIQs”)

The inspection questionnaires contained in this programme contain a series of questions related to safety and pollution prevention applicable to the type of vessel that is inspected. These questions are consecutively numbered and are logically grouped into separate chapters.

Each chapter contains a series of questions to be answered by the inspector. Questions *may* be accompanied by guidance, namely:

1. Guidance notes to inspectors;
2. Reference source(s) citing regulation(s) or industry guidelines pertaining to questions; and
3. An indicator to identify issues when an inspector comment is mandatory.

The above-mentioned guidance, regulatory/industry references amplify the questions and these are provided to assist the inspector to answer the questions.

If the guidance and references lead the inspector to conclude that the question should be answered positively, the box “**Yes**” in the VIQ computer programme should be checked. On the other hand, if the guidance and any reference sources indicate to the inspector that the question should be answered negatively, the “**No**” box should be checked.⁴ Where appropriate, the “**Not Seen**” or “**Not Applicable**” box should be ticked.

When inspecting oil tankers (together with combination carriers and shuttle tankers), chemical carriers and gas carriers of any size, the inspector *must* respond to all the questions, however, this is not the case when inspecting barges, towing vessels and vessels carrying packages cargoes⁵. ***Failure to do this will mean that the inspection report cannot be transmitted to the SIRE Internet site for processing by the principal who commissioned the inspection.***

The inspector *must* insert a comment when responding to any question where the response box is marked “**No**”. The comment *must specify and explain* the reason why a negative response is made. Additionally, where a box is marked “**Not Seen**” or “**Not Applicable**”, the reason for the response *must* be given in the comments section accompanying the questions. ***For some questions, the inspector is required to comment irrespective of how the question is answered. This requirement is flagged in the VIQ by bold, highlighted, italic text in the guidance notes.***

Finally, the inspector is free, at any time, to pass comment even where a box is marked “**Yes**” **provided such comment makes amplification to assist the understanding of a report recipient as to an issue associated with the specific question.**

At the end of each chapter there is an **Additional Comments** section. If the inspector has additional comments in respect of subject matter that is not covered by the specific questions in the chapter, the inspector may make such comments in the Additional Comments section.

⁴ A few Questions have neither guidance nor sub-questions. In such cases, the Inspector is required to make an unaided answer.

⁵ In the case of the inspection of barges, towing vessels and vessels carrying packaged cargoes, it is not necessary to respond to every question in the questionnaire. In these questionnaires, certain questions are indicated with the letter “M” to indicate that an inspector’s response is mandatory. Responses to questions that are not marked “M” are preferred, but are not mandatory.

The above listed requirements are summarised below.

Box	Option	Response
Y	Yes	Tick "Yes" if, in the inspector's professional judgement assisted by the guidance (if provided), a positive response can be made to the question.
N	No	Tick "No" if, in the inspector's professional judgement assisted by the guidance (if provided), a negative response should be made to the question.
NS	Not Seen	Tick "Not Seen" if the issue addressed by a question has not been seen or checked by the inspector.
NA	Not Applicable	Tick "Not Applicable" if the subject matter covered by the question is not applicable to the ship being inspected.
	Comments	A comment by the inspector is required for a "No" , "Not Seen" or "Not Applicable" response or where the question specifically calls for comment irrespective of how the response box is checked. Inspectors are free to record comments even where a box is checked "Yes" .
	Additional Comments	The Additional Comments section at the end of each chapter may be used to record comments in respect of the chapter that are additional to those which the inspector may make when responding to the specific questions.

3.2 VIQ Availability to Operators

Vessel operators who require copies of the questionnaires set out in this programme, may obtain them directly from the www.ocimf.com web site at no cost to the vessel operator.

SECTION 4

Conduct of Inspections

4.1 Mandatory Inspection Requirements

The following mandatory inspection requirements **must** be followed by Inspectors in the conduct of their shipboard inspection in order for reports to meet the requirements of the SIRE Programme:

Inspectors:

1. **Must** respond by entering the requested information or by checking one response box for each question;
2. **Must**, where guidance to a question is provided, consider all the guidance to determine how the question should be answered;
3. **Must** answer every question as it is written;
4. **Must** use objective evidence when answering each question (the assurance of the vessel's staff is insufficient evidence or proof);
5. **Must** include an explanatory comment in the comments section under a question when it is answered "**No**", "**Not Seen**" or "**Not Applicable**" and/or where the VIQ question or guidance requires a comment regardless of how a question is answered;
6. **Must not** use a "**Yes**" response to any question where an inspector's observation or comment contains negative elements (if there is such negative observation or comment then the answer to that question should be "**No**");
7. **Must not**, in any **Comment** or **Additional Comments**, include -
 - i. Any overall or partial ship rating or indication of ship acceptability non-acceptability;
 - ii. Any matter unrelated to the topic of a VIQ chapter and, in particular, any matter unrelated to ship safety and pollution prevention; and,
 - iii. Any overall chapter ending or other partial summary of the inspector's findings;
8. **Must** give the factual basis and specific reasons for any opinions or subjective comments made by the Inspector;
9. **Must** note any deficiencies or Inspector observed conditions as to which action was taken whilst the inspector was on board, and
10. **Must** not offer any comments or opinions with regard to actions to be taken in respect of any deficiencies or observed conditions noted by the inspector.

4.2 Permitted Inspection Actions

Inspectors *may*:

1. Include comments relating to any question, even where the question is answered with a “Yes” provided such comments give useful information to the report recipient;
2. Respond to questions or provide comments on the basis of material not included in the guidance specified for the question but must note this reliance and explain reason for the reliance;
3. Include in the “**Additional Comments**” for each chapter, any comments in respect of the subject matter not addressed by questions contained in the chapter additional to those that the inspector may make in response to the specific questions in the chapter; and
4. Respond to questions which are not applicable to either the vessel or its cargo by checking such questions “**Not Applicable**” and recording the words “**Not applicable**” in the **Comments** section.

4.3 Inspection Suggestions

1. The inspector should introduce himself or herself to the master or the master’s authorised deputy, explain the scope of the inspection and discuss the order in which it will be carried out. ***Inspectors should co-operate fully to conduct the inspection in the order that will cause the least disruption to the vessel’s operations.*** The master or one or more of the vessel’s officers should accompany the inspector at all times during the course of the inspection.
2. Unless authorised by the OCIMF Inspecting Member and agreed by the vessel’s operator, inspections should not take place at night. ***Inspectors must take into account statutory requirements relating to hours of rest.***
3. The inspector must set a good example with respect to his or her own personal safety procedures whilst on board the vessel and in the terminal and should wear appropriate personal protection equipment at all times.
4. Electrical or electronic equipment of non-approved type, whether mains or battery powered, should not be active, switched on or used within gas-hazardous areas. This includes torches, radios, mobile telephones, radio pagers, calculators, computers, photographic equipment and any other portable equipment that is electrically powered but not approved for operation in a gas-hazardous area. It should be borne in mind that equipment such as mobile telephones and radio pagers, if switched on, can be activated remotely and a hazard can be generated by the alerting or calling mechanism and, in the case of mobile telephones, by the natural response to answer the call.
5. The inspector should consider requesting that equipment be run and tested to confirm that it is in operational order and that officers and crew are familiar with its operation, but must ensure that such requests do not cause delay or interfere with the safety and normal operation of the vessel.
6. **It should be recognised that the overall objective of the inspection is to provide the user of a SIRE Report with a factual record of the vessel’s condition and standard of operation at the time of the inspection and, in turn, allow an assessment of the risk that use of the vessel might pose.**
7. **It is important that any observations that the inspector intends to record in the VIQ are pointed out and discussed ‘on site’ at the time.** This ensures that the crew fully understand the nature of the observations and it can also save discussion at the end of the inspection.
8. Tank entry should only be undertaken if a suitable safe opportunity exists, it is approved by the Inspecting Member and port regulations allow. At all times the most stringent safety procedures should be followed and an entry permit should be issued by an appropriate ship’s officer. The tests and precautions contained in ISGOTT should be observed and an entry into an enclosed space should not be made without the full knowledge and consent of the master.

SECTION 5

5.1 The Distributed Report

The responses recorded in the Vessel Inspection Questionnaires (the *Inspection Element*) serve as the basis for development of the second element of the Vessel Inspection Procedure (the *Report Element*) distributed under the programme. The inspector's completed VIQ must be reviewed by the submitting company prior to processing in the SIRE system and transmission to the vessel operator.

The processed VIQ is automatically converted into a report after it has been processed by the submitting company in the SIRE System. The report does not replicate the pages of the Vessel Inspection Questionnaire but is distributed in abbreviated form. It consists of a conversion of the inspector VIQ responses into a uniform report format. The report is divided into three sections as follows:

- | | |
|--|---|
| <p>Section 1
General information</p> | <ul style="list-style-type: none"> - Contains the informational responses required in Chapter 1 of the VIQ plus answers to certain questions from other VIQ chapters where specific details or dates are required. |
| <p>Section 2
Questions marked "Yes" without comment.</p> | <ul style="list-style-type: none"> - Lists, by index number only, the questions in the VIQ which have been checked with a "Yes" response, but without inspector comment. |
| <p>Section 3
Questions marked "No", "Not Seen", "Not Applicable" or otherwise commented upon and any chapter ending Additional Comments.</p> | <ul style="list-style-type: none"> - Contains; in their entirety, <ul style="list-style-type: none"> (a) All VIQ questions which have been answered with a "No", "Not Seen" or "Not Applicable" response, as well as the comments made by the inspector to supplement such responses; (b) All other VIQ questions which have otherwise been commented upon, together with the comment; and, (c) Any additional comments made at the end of the VIQ chapters. |

Chapter 1. General information

General notes:

Where reference is made simply to SOLAS or the FSS Code, these requirements apply to all vessels.

Where reference is made to SOLAS 2004, these requirements apply to vessels constructed after 1st July 2002.

Where reference is made to SOLAS 1974, this means SOLAS 74 as amended up to and including the 2001 Consolidated Edition and these requirements apply to vessels constructed before 1st July 2002.

The requirements of SOLAS 2001 Consolidated edition Chapter II-2 Part D (Fire safety measures for tankers) for vessels constructed before 1st July 2002 do not apply to tankers carrying only cargoes with a flashpoint above 60°C.

1.1 Name of the vessel:

Note: Prefixes (MT, MV, SS etc.) must not be used unless they are actually a part of the registered name of the vessel. The name must be entered exactly as it appears on the Certificate of Registry.

1.2 IMO number:

1.3 Date of inspection:

1.4 Port of inspection:

1.5 Flag:

If there has been a change of flag within the past 6 months, record the date and the previous flag.

1.6 Deadweight: (metric tonnes)

Note: For vessels with multiple load line certificates, this should be the maximum of the assigned deadweights.

1.7 Gross tonnage:

1.8 Date the vessel was delivered:

Any periods of lay up since delivery should be recorded.

Note: Record the date of delivery from the original builder.

1.9 Name of the OCIMF inspecting company:

Note: The VIQ software automatically inserts the name of the OCIMF Member.

1.10 Time the inspector boarded the vessel:

1.11 Time the inspector departed the vessel:

If the inspection was divided into more than one session, or was carried out by more than one inspector, record the details.

Note: Unless the inspection was conducted by more than one inspector, do not use the expression "we" in any comment.

1.12 Name of the inspector:

Note: The VIQ software automatically inserts the name of the inspector. This is for use by the inspecting OCIMF Member and for OCIMF internal purposes only and will not be displayed on the delivered report.

1.13 Vessel's operation at the time of the inspection:

Loading	Discharging	Bunkering	Ballasting	Deballasting	At anchor	Idle	At sea
River transit	Repairs afloat	In drydock	STS loading	STS discharging			

1.14 Product(s) being handled:

Crude Oil	Dirty petroleum products (low flash)	Dirty petroleum products (high flash)	Clean petroleum products	Vegetable oils
Animal oils	Chemicals	Liquefied gas	Other (specify)	

Notes: A volatile product is petroleum having a flash point below 60°C as determined by the closed cup method of testing.

If a cargo is being handled at a temperature within 10°C of its flashpoint, it should be considered volatile. Therefore a cargo with a flashpoint of 80°C should be considered volatile if handled at a temperature of 70°C or above.

MARPOL 13H prohibits the carriage of heavy grade oil in single hull tankers of 5,000 tons dwt and above and in single hull tankers of 600 tons dwt and above but less than 5,000 tons dwt, not later than the anniversary of their delivery date in 2008, after 5th April 2005.

Heavy grade oil is defined as:

- *Crude oils having a density at 15°C higher than 900 kg/m³;*
- *Fuel oils having either a density at 15°C higher than 900 kg/m³ or a kinematic viscosity at 50°C higher than 180 mm²/s;*
- *Bitumen, tar and their emulsions.*

1.15 Is an up to date OCIMF Harmonised Vessel Particulars Questionnaire (HVPO) available on board?

A complete and accurate copy of the HVPO, compiled using OCIMF HVPO software should be on board and available to the inspector. If not, record the reason.

Note: To participate in the OCIMF SIRE Programme as an HVPO submitting operator, contact OCIMF at sire@ocimf.com.

1.16 Vessel type:

Category 1 tanker	Category 2 tanker	Category 3 tanker	13E (PL) tanker	13F tanker
Chemical carrier Type I	Chemical carrier Type II	Chemical carrier Type III		
LPG Type A	LPG Type B	LPG Type C	LNG Moss Type	LNG Membrane
OBO	Ore-Oil	Shuttle tanker		

1.17 Hull type:

Single hull	Double hull	Double sides	Full breadth double bottom	Centre tank double bottom
-------------	-------------	--------------	----------------------------	---------------------------

Crude oil tankers of 20,000 tons dwt and above and product carriers of 30,000 tons dwt and above, delivered after 1st June 1982, shall have segregated ballast in a protective location so that the ship may operate safely without recourse to the cargo tanks for water ballast except in exceptional circumstances.

(MARPOL Annex 1/13 and 13E Protocol of 1978)

Notes: MARPOL Annex 1/13F double hull requirements apply to vessels of 600 tons dwt and above delivered after 6th July 1996.

MARPOL Annex 1/13G applies to tankers of 5,000 tons dwt and above delivered before 6th July 1996 which do not comply with 13F, 13F(3)(a) and (b), 13F(4) or 13F(5).

The 2001 amendments to MARPOL regulation 13G define the following categories of tanker:

Category 1: *Oil tankers of 20,000 tons dwt and above carrying crude oil, fuel oil, heavy diesel oil or lubricating oil as cargo and of 30,000 tons dwt and above carrying other oils, which do not comply with the requirements for protectively located segregated ballast tanks (Pre-MARPOL tankers).*

Category 2: *As above, but which do comply with the requirements for protectively located segregated ballast tanks (MARPOL tankers).*

Category 3: *Oil tankers of 5,000 tons dwt and above but less than the tonnage specified for Category 1 and 2 tankers.*

Category 1, 2 and 3 tankers have an accelerated phase-out timetable and most will be eliminated by 2010. 13G(4) details the year in which compliance with 13F is required, on the anniversary of the date of delivery.

Phase out dates:

Category 1: 5th April 2005 for ships delivered on 5th April 1982 or earlier;
2005 for ships delivered after 5th April 1982.

Category 2 and 3: 5th April 2005 for ships delivered on 5th April 1977 or earlier;
2005 for ships delivered after 5th April 1977 but before 1st January 1978;
2006 for ships delivered in 1978 and 1979;
2007 for ships delivered in 1980 and 1981;
2008 for ships delivered in 1982;
2009 for ships delivered in 1983;
2010 for ships delivered in 1984.

Under certain circumstances (including CAS) Category 2 and 3 tankers may be allowed by the administration to continue in operation until the anniversary date of the delivery of the ship in 2015, or the date on which the ship reaches 25 years after the date of its delivery, whichever is the earlier.

In the case of certain Category 2 or 3 tankers fitted with only double bottoms or double sides not used for the carriage of oil and extending to the entire cargo tank length or double hull spaces, not meeting the minimum distance protection requirements, which are not used for the carriage of oil and extend the entire cargo tank length, the administration may allow continued operation beyond 2010 provided the ship was in service on 1st July 2001. Such continued operation must not go beyond the date on which the ship reaches 25 years of age after the date of its delivery.

Under 13G(7) Category 2 and 3 vessels may continue in operation beyond the anniversary date of delivery in 2010 subject to compliance with the Condition Assessment Scheme.

1.18 Name of the vessel's operator:

Notes: For the purpose of the SIRE Programme, an 'operator' is defined as the company or entity which exercises day to day operational control of, and responsibility for, a vessel. The name of this entity can be found in the vessel's Document of Compliance.

The registered owner of a vessel may or may not be the operator.

1.19 Address of the vessel's operator:

Note: If this report is to be forwarded to an alternative address, record the details.

1.20 Telephone number of the operator: +**1.21 Facsimile number of the operator: +****1.22 E-mail address of the operator:****1.23 Date the current operator assumed responsibility for the vessel:****1.24 Date of the last port State control inspection:****1.25 Port of the last port State control inspection:**

If the vessel was detained, or if significant deficiencies were listed, record the reason for the detention or the nature of those deficiencies.

Note: Port State inspection reports should be retained on board for a period of at least two years.

Additional Comments:

If the Inspector has comments in respect of the subject matter covered by the Chapter additional to those which the Inspector may make in response to the specific questions in the Chapter, the Inspector should include such additional comments in this section.

Chapter 2. Certification and documentation

Certification:

2.1 Are all the statutory certificates listed below, where applicable, valid and have the annual and intermediate surveys been carried out within the required range dates?

2.1.1	Certificate of Registry
2.1.2	<p>Continuous Synopsis Record <i>Issued in accordance with SOLAS XI-1/5 by the administration, from 1st July 2004.</i> <i>Whenever any change to the entries listed in the current CSR document has taken place, pending the issue of a revised and updated CSR, the operator or the master is required to complete an amendment form (Form 2), the original of which is to be attached to the current CSR. The index of amendments (Form 3) must be updated.</i></p>
2.1.3	<p>Document of Compliance (DoC) <i>The issuing authority for the DoC and the SMC may be different organisations, but the name of the operator of the vessel must be the same on both.</i> <i>There should be a copy (which need not be a certified copy) of the DoC on board, which shows that the original has been endorsed for the annual verification.</i> <i>The document should detail the cargo types the operator's vessels are certified to carry – i.e. oil, chemicals and/or gas.</i> <i>The Document of Compliance does not need to be endorsed for chemicals if the vessel has only a NLS Certificate and not a Certificate of Fitness.</i> <i>An annual audit should be carried out within three months of the anniversary of the date of issue.</i></p>
2.1.4	<p>Safety Management Certificate (SMC) <i>The SMC is subject to renewal verification every five years and at least one intermediate verification, which, if only one, shall be between the second and third anniversary.</i></p>
2.1.5	<p>Safety Equipment Certificate, supplemented by Form E <i>Form E was revised by the SOLAS 2000 amendments to include an additional Section 3 – 'Details of navigational systems and equipment', in force from the first Safety Equipment Survey after 1st July 2002.</i> <i>The Safety Equipment Certificate does not need to be endorsed for chemicals if the vessel has only a NLS Certificate and not a Certificate of Fitness.</i></p>
2.1.6	Safety Radio Certificate , supplemented by Form R
2.1.7	<p>Safety Construction Certificate <i>The Safety Equipment, Safety Radio and Safety Construction Certificates might be on the same form, called the Ship Safety Certificate. Form C will be attached instead of Forms E and R. There should be evidence that each annual survey has been carried out.</i> <i>Form C was revised by the SOLAS 2000 amendments to include an additional Section 5 – 'Details of navigational systems and equipment', in force from the first Safety Certificate Survey after 1st July 2002.</i> <i>The Safety Construction Certificate does not need to be endorsed for chemicals if the vessel has only a NLS Certificate and not a Certificate of Fitness.</i></p>
2.1.8	<p>IOPP Certificate, supplemented by Form A or B <i>Form B is only required if carrying oil cargoes or oil-like noxious liquids substances. A list of the oil-like noxious liquid substances allowed to be carried must be included.</i> Statement of Compliance supplement <i>Required for vessels subject to the Condition Assessment Scheme (see question 2.22). A Statement of Compliance should be issued by the administration every 2½ years.</i></p>
2.1.8.1	<p>What is the vessel's designation as recorded in the IOPP Certificate, Form B, Question 1.11?</p> <ul style="list-style-type: none"> • <i>Crude oil tanker;</i> • <i>Product carrier;</i> • <i>Product carrier not carrying fuel oil or heavy diesel oil as referred to in regulation 13G(2^{bis}), or lubricating oil;</i> • <i>Crude oil/product carrier;</i>

	<ul style="list-style-type: none"> • <i>Combination carrier;</i> • <i>Ship, other than an oil tanker, with cargo tanks coming under regulation 2(2) of Annex 1 of the Convention;</i> • <i>Oil tanker dedicated to the carriage of products referred to in regulation 15(7);</i> • <i>The ship, being designated as a 'crude oil tanker' operating with COW, is also designated as a 'product carrier' operating with CBT, for which a separate IOPP Certificate has also been issued;</i> • <i>The ship, being designated as a 'product carrier' operating with CBT, is also designated as a 'crude oil tanker' operating with COW, for which a separate IOPP Certificate has also been issued;</i> • <i>Chemical tanker carrying oil; or</i> <p>Or a Form A supplement is being used</p>
2.1.9	Loadline Certificate
2.1.10	<p>International Ship Security Certificate <i>The ISPS Code came into effect on 1st July 2004.</i></p> <p><i>The ISSC is subject to renewal verification every five years and at least one intermediate verification, which, if only one, shall be between the second and third anniversary.</i></p> <p><i>The ISS Certificate does not need to be endorsed for chemicals if the vessel has only a NLS Certificate and not a Certificate of Fitness.</i></p>
2.1.11	<p>International Sewage Pollution Prevention Certificate <i>Applies to vessels delivered after 27th September 2003 and to existing vessels by 27th September 2008.</i></p>
2.1.12	International Tonnage Certificate
2.1.13	<p>Minimum Safe Manning Document</p> <p>Required manning Officers: Ratings: Actual manning Officers: Ratings:</p>
2.1.14	<p>International Anti-fouling System Certificate, or Statement of Compliance <i>The IAFS Convention on the control of antifouling systems is not yet in force, but it is recommended that owners comply not later than 1st January 2003. (MEPC.102)</i></p>
2.1.15	<p>Engine Air Pollution Prevention Certificate, with supplement <i>Required for each engine of more than 130 kw installed on or after 1st January 2000, with Records of Construction, a Technical File and Means of Verification.</i></p> <p><i>Annex VI (Regulations for the Prevention of Air Pollution from Ships) will enter into force on 19th May 2005.</i></p>
2.1.16	<p>Certificate of Fitness for the Carriage of Chemicals or Gas <i>This will be issued either under the IBC or BCH Code for chemicals, or the IGC, GC or EGC Code for gas. Gas carriers carrying dual code cargoes must have a NLS Certificate.</i></p>
2.1.17	<p>Noxious Liquid Substances Certificate <i>A NLS Certificate is required for any vessel carrying a MARPOL Annex 2 cargo that does not have a Certificate of Fitness for the Carriage of Chemicals.</i></p> <p><i>It is not a requirement that the Document of Compliance and Safety Equipment and Safety Construction Certificates are endorsed 'Chemical tanker' when the vessel is only carrying chemicals under a NLS Certificate.</i></p>
2.1.18	<p>Civil Liability Convention (1992) Certificate <i>The name of the owner should be the same as that on the Certificate of Registry.</i></p>
2.1.19	<p>Name of P and I Club: <i>The name of the owner should be the same as that on the Certificate of Registry.</i></p> <p><i>There should be a P and I Club Certificate of Entry to prove membership for the current year, which usually begins on the 20th February.</i></p>
2.1.20	US Certificate of Financial Responsibility
2.1.21	<p>USCG Certificate of Compliance Date of expiry: <i>A Certificate of Compliance is issued to all oil, chemical and gas tankers and is valid for two years.</i></p> <p><i>Record if the vessel is Qualship certified.</i></p>

With respect to SOLAS certificates, if the language used is neither English nor French, the text shall include a translation into one of these languages. (SOLAS I/15)

Notes: Some certificates may now be issued in Spanish, such as the International Ship Security Certificate. (ISPS Code Part A/19.2.4)

The requirement for the Minimum Safe Manning Certificate to be translated into English is contained in IMO Res. A.890 Annex 3.2.

Safety management and the operator's procedures manuals:

2.2 Do the operator's procedures manuals comply with ISM Code requirements?

It is not a requirement that the manuals be written in English. However, if not, the fact should be recorded.

Notes: Key elements of the ISM Code that should be incorporated into the procedures manuals are that they should be:

- *Relevant to the ship;*
- *User friendly;*
- *Written in the working language of the crew.*

And that they should at least contain:

- *A safety and environmental policy;*
- *Emergency procedures;*

Note: Emergency procedures should at least include collision, grounding, flooding, heavy weather damage, structural failure, fire (on deck and in cargo tanks, the engine room, pump room and accommodation), explosion, gas or toxic vapour release, critical machinery failure, rescue from enclosed spaces, serious injury and helicopter operations.

- *A description of the master's and crew's responsibilities;*

Note: The operator should establish in the safety management system that the master has the overriding authority and the responsibility to make decisions with respect to safety and pollution prevention and to request the operator's assistance as may be necessary. (ISM Code 5.2)

- *Shipboard operation plans;*
- *Procedures for reporting non-conformities and for corrective action;*
- *Maintenance programmes;*
- *Procedures for auditing and reviews;*
- *Programmes of drills,*

Notes: The programme of drills must at least include the emergency procedures detailed above and in addition abandon ship, man overboard, pollution clean up and ship security including dealing with terrorism and piracy.

Occasionally the operator's procedures are available only in computerised versions. Ascertain whether there is adequate access for all personnel to a computer and whether adequate training has been given to all personnel in accessing the operator's procedures using one. In any case, a hard copy of the operator's navigation procedures should be available on the bridge.

2.3 Has the operator's representative visited the vessel within the last six months?

2.4 Is a recent operator's audit report available and is a close-out system in place for dealing with non-conformities?

Note: Satisfactory evidence should be available that corrective action was taken to attend to any non-conformity identified. A close-out system, which includes a time limit for corrective action, informing the operator when completed and the operator ensuring that it has been, should be in place and the inspector should ensure that the required actions have been made within the required time. Operator's audits must not be used as a means to record observations.

2.5 Does the master review the safety management system and report to the operator on any deficiencies?

Note: The master's review should be carried out annually and there should be documentary evidence of these available.

Class documentation and surveys:

2.6 Classification society:

If the vessel has dual class, record the name of the classification society issuing the statutory certificates and the name of the second society.

If the vessel has changed class within the past 6 months, record the previous classification society and the date of change.

Notes: A Classification Society Certificate must be available and the periodic annual and intermediate surveys must have been carried out within the stipulated range dates.

Vessels holding an Ice Class notation must be constructed to meet the requirements specified by the Classification Society and the officers and ratings provided with suitable clothing and appropriate training. Subject to the Ice Class notation to which the vessel was constructed, vessels will be equipped to maintain temperature within the accommodation, protect the hull, deck machinery, pipelines, ventilators, air inlets, sea inlets and ballast system against freezing. Means to receive and display ice charts and ice navigation information should be installed. Protection to prevent the wheelhouse windows from freezing should be provided and if the wheelhouse is not totally enclosed, protected locations on the bridge wings and searchlights on each bridge wing should also be provided. If the vessel holds an Ice notation, inspectors should assess these provisions and provide comments in the Additional Comments sections at the end of this chapter.

Where the vessel has changed class within the past six months a copy of the previous class latest survey status report must be available.

It is an important requirement of P and I Clubs that the vessel is fully in class with an approved Classification Society throughout the period of club entry.

2.7 Date of expiry of the Class Certificate:

Note: This will usually be the same date as that of the next special survey.

2.8 Date the last special survey was completed:

2.9 Date of departure from the last class-credited drydock:

In addition, if the last drydocking was unscheduled, record the date and the reason.

Note: The date of the last class-credited drydock can be found in the Classification Society Survey Status Report.

2.10 Was the last scheduled repair period conducted in drydock?

Note: If the vessel has undergone an in-water survey instead of a dry docking the question must be answered 'No'.

2.11 Date the last class intermediate survey was completed:

2.12 Date the last class annual survey was completed:

Note: Insert the date of the intermediate survey if that was the last survey which was carried out.

2.13 Date of the last class Survey Status Report:

Note: The last status report should be dated not more than four months prior to the date of the inspection. Class Survey Status Reports may not have been updated to reflect the latest status, despite the date of the document. However, class surveyors leave documentation on board at the time of surveys stating what has been carried out and these should be examined to ensure the correct information is reported.

2.14 Are class survey reports adequately filed?

Notes: The file should contain class reports based on annual, intermediate, special and occasional surveys.

The survey and repair reports should be adequately filed to facilitate checking.

2.15 Is the vessel free of conditions of class or significant recommendations, memoranda or notations?

Record any conditions of class or significant recommendations, memoranda or notations of any nature, including due dates.

Where class records address structural issues of concern, including bottom pitting, areas of substantial corrosion, cracks, buckling or serious indents, record the details as to the extent and the measures taken to arrest further development.

Where a condition of class has been postponed, the details including the condition, original date and the new date for completion should be recorded.

If records indicate that measures have been taken to address or restore loss of longitudinal or transverse strength, record the details and the repairs undertaken. The existence of doublers anywhere within the vessel's structure and deck strapping must be reported.

Note: If conditions of class have not been completed by the required due date, then the classification of the vessel may be subject to suspension.

2.16 Are procedures in place to carry out regular inspections of cargo and ballast tanks, void spaces, trunks and cofferdams by the vessel's personnel and are records maintained?

Notes: This requirement is for every vessel regardless of whether it is subject to enhanced survey.

Annual inspections of the spaces should be made and records maintained. These should include a plan of each compartment with all its boundaries and should at least contain details and the location of:

- *Structural deterioration and failure;*
- *Extent of corrosion, pitting and wastage;*
- *Extent of deterioration of any coating;*
- *Any leakages in bulkheads or pipework;*
- *The condition of cargo handling and monitoring equipment;*
- *Extent of sediment build up.*

Enhanced Survey Programme:

2.17 If the vessel is subject to the Enhanced Survey Programme, is the report file adequately maintained?

Key contents of the Condition Evaluation Report should be recorded, including the date conducted, the tanks inspected and a summary of the condition of the tank coatings.

Notes: SOLAS XI-1/2 requires all oil tankers, regardless of size, to be subject to Enhanced Surveys. The regulation refers to SOLAS II-1/2.12, which in turn refers to MARPOL Annex 1/1(4) which states that an 'oil tanker is a ship constructed or adapted to primarily carry oil in bulk and any chemical tanker as defined in Annex II when it is carrying a cargo or part cargo of oil in bulk'. The Unified Interpretations of Annex 1/1(4) state that 'a gas carrier when carrying a cargo or part cargo of oil in bulk should be treated as an oil tanker.'

This effectively means that any vessel when carrying a cargo or part cargo of oil in bulk is subject to enhanced survey requirements under SOLAS XI-1/2.

The guidelines for enhanced surveys are contained in IMO Res. A.744(18). They state that for MARPOL 13G, which applies to tankers carrying persistent product oil, including heavy diesel oil, fuel oil or lubricating oil, of 20,000 tons dwt and above and to product carriers of 30,000 tons dwt and above, the guidelines are mandatory. They include the requirement that an oil tanker over five years of age shall have on board a complete file of survey reports, including the results of all scantling measurement required, as well as the statement of structural work carried out. This file may be provided at the time of delivery but should, in all cases, be available on board at least one year prior to the vessel's fifth anniversary. The file shall be accompanied by a Condition Evaluation Report containing conclusions on the structural condition of the ship and its residual scantlings.

'Substantial corrosion' is wastage in excess of 25% of allowable margins, but within acceptable limits.

Each Enhanced Survey File must contain a Condition Evaluation Report for each Enhanced Survey which has been carried out.

2.18 Is a thickness measurement report available?

Give brief details of the results of the thickness measurements.

Notes: The form of tabulation of thickness measurements is detailed in Res. A.744(18).

Thickness measurements may be waived under some circumstances such as if the tank coatings are in good condition.

2.19 Is the following documentation available on board?

- Main structural plans for cargo and ballast tanks;
- Previous repair history;
- Cargo and ballast history;
- Extent of use of the inert gas plant and tank cleaning procedures.

Note: This documentation need not necessarily be kept in the same file.

2.20 If the vessel is over 130 metres in length and is over ten years old, has the criteria for longitudinal strength of the hull girder for oil tankers been met?

Record the results of the evaluation, with details of any repairs undertaken.

Notes: See the requirements for reporting measures to restore longitudinal strength, such as strapping, under question 2.15.

Evaluations are required at Safety Construction Certificate renewal surveys. The results should be available within the Condition Evaluation Report. The requirements came into force on 1st July 2002 and therefore only Condition Evaluation Reports after this date will include the evaluation.

Condition Assessment Scheme:

- 2.21 If the vessel is subject to the Condition Assessment Scheme (CAS), are copies of the Condition Assessment Scheme Final Report and Review Record available?**

The results and dates of CAS surveys should be reported.

CAS is a separate issue from enhanced survey and although CAS does not specify structural standards in excess of the provisions of other IMO conventions, its requirements stipulate more stringent and transparent verification of the reported structural condition of the vessel and that documentary and survey procedures have been properly carried out and completed. The scheme requires that compliance with the CAS is aligned to the enhanced survey programme of inspections concurrent with intermediate or renewal surveys currently required by IMO Res. A.744(18). (MEPC.94)

Notes: In accordance with the revised MARPOL 13G, CAS is to be applied to all single hulled tankers of 15 years or older.

The administration may permit Category 2 and 3 tankers to continue in operation beyond 2010 subject to satisfactory results from the Condition Assessment Scheme. but the continued operation must not go beyond the anniversary of the date of delivery of the ship in 2015 or the date on which the ship reaches 25 years of age after the date of its delivery, whichever is earlier.

- 2.22 Has a Survey Plan for the CAS been completed and submitted by the operator?**

Note: The Survey Plan should be submitted not less than 2 months prior to the commencement of CAS.

- 2.23 If the vessel has been enrolled in a Classification Society Condition Assessment Programme (CAP):**

Which society?

What hull rating has been awarded?

Date of the CAPS survey:

Note: The date should be that when the survey was actually completed, not the date of the certificate.

Publications:

- 2.24 Are the publications listed in the table below, as applicable to the vessel, available?**

Note: The inspector should make spot checks to ensure that the publications, as appropriate to the vessel, are provided.

General and management publications:

	Publication	Publisher	Edition	Date
2.24.1	SOLAS Consolidated edition with amendments	IMO	-	2004
2.24.2	<ul style="list-style-type: none"> • LSA Code <i>The Code includes 'Testing and Evaluation of Lifesaving Equipment'.</i>	IMO	2 nd	2003

Additional Comments:

If the Inspector has comments in respect of the subject matter covered by the Chapter additional to those which the Inspector may make in response to the specific key questions in the Chapter, the Inspector should include such additional comments in this section.

Chapter 3. Crew management

Note: Co-operation and communication between officers and crew should be observed and evaluated. All parties should share a common goal to operate the vessel safely and efficiently.

Crew management:

3.1 Does the manning level meet or exceed that required by the Minimum Safe Manning Document?

The IMO Resolution A.890 Principles of Safe Manning addresses the functions to be addressed when determining the safe manning of a vessel, including navigation, cargo handling, safety, engineering, electrical and electronic engineering, radiocommunications and maintenance. (Res. A.890 Annex 2)

The Resolution also states that except in ships of limited size or propulsion power (which are not quantified), the determination of the minimum safe manning level should also take into account the provision of qualified officers to ensure that it is not necessary for the master or chief engineer to keep regular watches by adopting a three-watch system. (Res. A.890 Annex 2)

The administration should take into account any additional workload which may result from the implementation of the Ship Security Plan and ensure that the ship is sufficiently and effectively manned. In doing so the administration should verify that ships are able to implement the hours of work and other measures to address fatigue which have been promulgated by national law. (ISPS Code Part B 4.28)

Note: Inspectors should review the number of personnel on board against the level of operation and should consider issues such as whether:

- *The bridge is being adequately manned under all sailing conditions;*
- *There are sufficient personnel to moor the ship safely;*
- *The cargo operation is being effectively controlled (if two deck officers alternate the cargo watches, is the second officer adequately experienced and qualified and are ratings sufficiently familiar with the operation);*
- *Safety functions are being adequately addressed (drills, ship security issues, equipment maintenance); and*
- *The quality of rest is adequate considering the trading area and the workload.*

3.2 Is the operator's policy that controls hours of work to minimise fatigue being followed?

3.3 Do all personnel maintain hours of rest records and are the hours of rest in compliance with STCW requirements?

Administrations should consider the introduction of a requirement that records of hours of work or rest of seafarers should be maintained. (STCW Code Section B VIII/1-4)

All persons who are assigned duty as officer in charge of a watch or as a rating forming part of a watch shall be provided a minimum of 10 hours rest in any 24-hour period.

The hours of rest may be divided into no more than two periods, one of which shall be at least 6 hours in length.

The requirements for rest periods need not be maintained in the case of an emergency or drill, or in other overriding conditions. 'Overriding operational conditions' are defined (Section B VIII/1.1) as to mean only essential shipboard work which cannot be delayed for safety or environmental reasons, or which could not have been reasonably anticipated at the commencement of the voyage.

Notwithstanding the above, the minimum period of 10 hours may be reduced to not less than 6 consecutive hours provided that any such reduction shall not extend beyond 2 days and not less than 70 hours of rest are provided in each 7-day period. (STCW Code Part A VIII/1)

Note: The IMO publication 'Guidelines on Fatigue' contains valuable guidance on dealing with fatigue, references to instruments relating to fatigue and model formats for records of hours of work or rest.

3.4 Are all personnel able to communicate effectively in a common language?

Record the common working language.

On all ships, to ensure effective crew performance in safety matters, a working language shall be established and recorded in the ship's logbook. The operator or the master shall determine the appropriate working language. Each seafarer shall be required to understand and, where appropriate, give orders and instructions and to report back in that language. If the working language is not an official language of the flag of the State the ship is entitled to fly, all plans and lists required to be posted shall include a translation into the working language. (SOLAS V/14.3)

3.5 Does the operator provide a training policy exceeding statutory requirements?

Record the type of training the operator provides.

Note: Training includes formal courses, in-house or on-board training and the regulated use of videos.

3.6 Have senior deck officers attended bridge team management courses?

Note: These should be formal shore-based courses and officers should have evidence of having attended them.

3.7 Has the master attended a shiphandling course?

3.8 If the vessel is equipped with an ECDIS, electronic chart display system or an integrated navigation system, have all the deck officers attended appropriate training courses for operating the equipment?

Note: If the vessel is equipped with an ECDIS whether approved or not, navigating officers should have evidence of having attended an appropriate training course in the equipment. Where an ECD or INS is fitted, attendance at a course is only preferred.

3.9 Where the vessel carries chemicals, has a formal programme of regular, chemical-specific medical checks and blood tests for personnel been implemented?

Crew qualifications:

3.10 Are the officers and crew suitably qualified and is their training and experience adequate?

QUALIFICATIONS OF OFFICERS	Master	Chief officer	2 nd officer	*	*	*	Radio officer
Nationality							
Certificate of Competency							
Issuing country							
Administration acceptance	Y N A	Y N A	Y N A	Y N A	Y N A	Y N A	Y N A

**In the "Qualification of Officers" section of the table above, enter the ranks of the deck officers below the rank of 2nd Officer who are on board at the time of the inspection.*

Inspectors should record in the matrix as to whether each officer is qualified under STCW V/1.1 or V/1.2.

***If the master has been promoted within the last 12 months, record how he obtained his ship handling experience for this class of vessel.*

Administration acceptance is either Yes, No, or Applied for.

Note: Experience could have been obtained either by attending a ship-handling course that could simulate the manoeuvring characteristics of the class of vessel or by serving as chief officer on this or a sister vessel. If neither of these, determine how ship-handling experience was gained?

QUALIFICATIONS OF OFFICERS	Chief engineer	*	*	*	*	*	*	*
Nationality								
Certificate of Competency								
Issuing country								
Administration acceptance	Y N A	Y N A	Y N A	Y N A	Y N A	Y N A	Y N A	Y N A

Years on this type of tanker								
Years on all types of tanker								
Months on vessel this tour of duty								
English proficiency Good / Fair / Poor	G F P	G F P	G F P	G F P	G F P	G F P	G F P	G F P

**In the "Qualification of Officers" section of the table enter the ranks of the engineering officers, including electrical/electronics officers, below the rank of Chief Engineer who are on board at the time of the inspection.*

Certificates should be in the official language of the issuing country and should include a translation into English. (STCW Convention I/2.1)

Any certificate required by the STCW Convention must be kept available in its original form on board the ship on which the holder is serving. (STCW Convention I/2.9)

Tanker qualifications:

Officers and ratings assigned specific duties and responsibilities related to cargo or cargo equipment on tankers shall have completed:

- At least three months of approved seagoing service on tankers in order to acquire adequate knowledge of safe operational practices; or*
- An approved tanker familiarisation course. (STCW Convention V/1.1)*

Masters, chief engineers, chief mates, second engineer officers and any person with immediate responsibility for loading, discharging and care in transit or handling cargo shall, in addition to meeting the requirements of paragraph 1, have:

- Experience appropriate to their duties on the type of tanker on which they serve; and*
- Completed an approved specialised training programme. (STCW Convention V/1.2)*

Administrations shall ensure that an appropriate certificate is issued to masters and officers who are qualified in accordance with paragraphs 1 or 2 as appropriate, or that an existing certificate is duly endorsed. Every rating who is so qualified shall be duly certificated. (STCW Convention V/1.4)

Notes: If the officers' certificates are not issued by the same administration as the flag State of the vessel, then an endorsement (or a separate document) is required which attests to the recognition of that certificate by the vessel's administration. An administration may allow a seafarer to serve for a period not exceeding 3 months, provided that documentary proof of an application is readily available.

The operator's policy should ensure that the master and chief officer and the chief engineer and second engineer, are not relieved at the same time and that there is a suitable handover period for all four ranks.

Tanker qualification at a management level (STCW V/1.2) is required by the master, chief officer, chief engineer and second engineer and any person with immediate responsibility for loading and discharging and care in transit or handling of cargo. Some administrations interpret this to require all watchkeeping deck officers to possess certification at the management level.

Junior officers and ratings assigned specific duties and responsibilities related to cargo or cargo equipment will automatically be qualified at an operational level for all three types of tanker if they have completed the approved familiarisation course (STCW V/1.1.1). If their certification is based on seagoing service then it will be solely for the type of tanker they served on.

If, in addition to the master, there are only two deck officers who share the cargo watches, both should have completed the approved specialised training programme.

Where a vessel is carrying chemicals under a Noxious Liquids Certificate, it is a matter for the particular administration whether the officers require chemical tanker endorsements in addition to their petroleum endorsements.

Drug and alcohol policy:

3.11 Does the operator have a Drug and Alcohol policy meeting OCIMF guidelines?

3.12 Record the defined maximum level of blood alcohol content:

OCIMF recommends that officers and ratings observe a period of abstinence from alcohol prior to scheduled watchkeeping duty or work periods. The objective should always be to ensure that, prior to going on scheduled duty the blood alcohol content of the seafarer is theoretically zero.

(OCIMF Guidelines for the control of drugs and alcohol)

3.13 Record the frequency of unannounced drug testing:

3.14 Record the frequency of unannounced alcohol testing:

The frequency of unannounced testing should be sufficient so as to serve as an effective deterrent to abuse.

(OCIMF Guidelines for the control of drugs and alcohol)

3.15 Record the date of the last unannounced on-board alcohol test:

3.16 Record the date of the last unannounced drug and alcohol test undertaken by an external agency:

Note: This should be the date of the test carried out on board either by an independent agency or under controlled conditions by ship's personnel with specimens being forwarded to an independent agency.

Additional comments:

If the Inspector has comments in respect of the subject matter covered by the Chapter additional to those which the Inspector may make in response to the specific key questions in the Chapter, the Inspector should include such additional comments in this section.

Chapter 4. Navigation

Compliance with the operator's navigation procedures should be evaluated both by observation and by discussion with the master and officers. The objective should be to ascertain that the policies are understood and that records show that they are being complied with.

Navigation equipment should be in an operational condition. Defective navigational equipment can result in collision or grounding with the consequent risk of pollution. Evidence should be available to show that periodic checks of navigational equipment are made at sea.

Policies, procedures and documentation:

4.1 Is the vessel provided with adequate operator's navigation instructions and procedures?

Notes: The navigation, training and bridge procedures policies should be reviewed. The existence of established bridge organisation procedures and the professional application of ship handling and navigational practices in compliance with international regulations should be ascertained.

Bridge manuals and navigation procedures should include general information and requirements on bridge organisation, watchkeeping, navigation and navigation equipment, charts, pilotage and port arrival and departure procedures.

The operator's procedures should include at least the following:

- *A clear statement that safety of life and the safety of the ship take precedence over all other considerations;*
- *Allocation of bridge watchkeeping duties and responsibilities for navigating procedures;*
- *A clear definition of the duties of the watch-keeping officers;*
- *Circumstances when the master must be called;*
- *Procedures for voyage planning and execution;*
- *Chart and nautical publication correction procedures including, if appropriate, electronic chart corrections;*
- *Procedures to ensure that all essential navigation equipment is available and fully operational;*
- *Ship position reporting procedures;*
- *Recording of voyage events.*

A hard copy of the operator's navigation policy and procedures must be available on the bridge.

During port entry and pilotage up to the time of berthing, a minimum of two persons should be on the bridge, which ensures that one person is available to adequately monitor the progress of the vessel and the other is available to provide a back up.

4.2 Does the operator provide guidance on minimum under keel clearance and squat?

Record the operator's policy relating to their underkeel clearance requirements for ocean passage, shallow water and for within port limits.

Notes: The operator's navigation policy should include a minimum allowed under keel clearance for both deep sea and coastal navigation and guidance on the action to be taken in shallow water to ensure the minimum clearance is maintained

Under keel clearance can be affected by several factors and allowances should include, but not necessarily be limited to:

- *The predicted height of the tide;*
- *Changes in the predicted tidal height, which are caused by, for example, wind speed and direction and high or low barometric pressure;*
- *Nature and stability of the bottom – i.e. sand waves, siltation etc.;*
- *Accuracy of hydrographic data, a note as to the reliability of which is often included on charts;*
- *Change of water density and the increase in draught due to fresh water allowance;*
- *The vessel's size and handling characteristics and increase in draught due to heel;*
- *Wave response allowance, which is the vertical displacement of the hull due to heave, roll and pitch motions;*
- *The reliability of draft observations and calculations, including estimates of hogging and sagging;*
- *Reduced depths over pipelines and other obstructions.*

Once the available under keel clearance has been calculated taking into account all the applicable factors, including those above, it can then be determined whether any speed reduction is required to counter the effects of squat.

Squat information relevant to the vessel for both loaded and ballast passages should be readily available on the bridge.

Where there is doubt that sufficient clearance can be maintained during any part of the voyage, the master must:

- Inform the operator at the earliest opportunity;
- If within port limits, obtain the latest sounding information, including the nature of the bottom, directly from the local authorities or terminal well before arrival. Should this not be available, the master should request guidance from the operator;
- If alongside, vacate the berth if in any doubt about the risk of grounding. It should be recognised that occasionally smaller vessels 'take the ground' – i.e. sit on the bottom - at some ports. This may even be to the extent that the berth dries out completely. In such circumstances considerable reliance is placed on previous experience, as often there is no other information available to ensure that the berth is safe. In such circumstances, documentary evidence should be sought to demonstrate that the operator is aware that the vessel takes the ground at these particular ports and that the situation has been fully assessed, including the effects of stress and stability and the nature and level of the bottom. Adequate procedures should be in place for maintaining services such as fire fighting and engine cooling water.

4.3 Are deck log books and engine movement (bell) books correctly maintained and is an adequate record being kept of all the navigational activities, both at sea and under pilotage?

All ships engaged on international voyages shall keep a record of navigational activities and incidents which are of importance to safety of navigation and which must contain sufficient detail to restore a complete record of the voyage. (SOLAS V/28)

Notes: Information which should be recorded includes that concerning position, course and speed, the times and positions when passing waypoints, land or sea marks, weather and sea conditions and incidents and events including pilot embarkation/disembarkation, times of attendance and connection and disconnection of tugs, times of berthing and unberthing, hazardous occurrences and accidents.

Records should be maintained whether the vessel is on international voyages or not.

Log books and engine movement (bell) books should be checked to ensure that they are up to date with entries properly made in ink and not in pencil.

An electronic chart display system with GPS input (provided the equipment is in good order and the datum used in each case is the same) provides a good record of the navigational activities.

4.4 Are procedures in place for the testing of bridge equipment before arrival and departure?

The steering gear shall be checked and tested within twelve hours of departure. (SOLAS V/26.1)

The date upon which the checks and tests are carried out and details of emergency steering drills shall be recorded. (SOLAS V/26.6)

4.5 Are pre-arrival, pre-departure, watch handover and pilot-master interchange checklists being completed?

4.6 Are records maintained of fire rounds being completed after each watch?

Note: A lookout should not leave the bridge during the watch as this contravenes the requirements of SOLAS and STCW. Rounds of the vessel should be conducted after the end of each watch.

4.7 Are the vessel's manoeuvring characteristics displayed on the bridge?

For all ships of 100 metres in length and over and all chemical tankers and gas carriers regardless of size, a pilot card, wheelhouse poster and manoeuvring booklet should be provided. (IMO Res. A.601)

The wheelhouse poster should be permanently displayed in the wheelhouse. It should be of such a size to ensure ease of use. (IMO Res. A.601)

Note: The recommended form of the wheelhouse poster is contained in IMO Res. A.601 and in the **Bridge Procedures Guide**.

4.8 Are auto to manual steering changeover procedures clearly identified?

Simple operating instructions with a block diagram showing the change-over procedures for remote control systems and steering gear power units shall be permanently displayed on the navigation bridge and in the steering gear compartment. (SOLAS V/26.3.1)

4.9 Has the master written his own standing orders and are night orders being completed?

Notes: Standing Order and Night Order Books should be checked to ascertain that all officers are instructed as to their responsibilities. Standing orders should be written by the master to reflect his own

requirements particular to the vessel, the trade and the experience of the deck officers aboard at the time.

Night orders should be written as and when they are required to supplement the standing orders.

4.10 Have the deck officers countersigned the master's standing and night orders as being read and understood?

4.11 Are regular gyro and magnetic compass errors being taken and are they being recorded?

Notes: The gyro error and magnetic compass deviation should be ascertained every watch. Where weather conditions or traffic density makes it impractical, this fact should be noted in the Deck Log Book or Compass Error Book.

The error of the gyro should be determined by external observations – celestial bearings, transits etc. and the gyro and magnetic compass headings then compared to determine the magnetic compass error. Where a gyro repeater is used to take a bearing an accurate comparison between the repeater and the master gyro should be made.

4.12 Do the errors being recorded in the compass error book broadly agree with the deviation card?

Notes: An observation should be made if the magnetic compass error differs by more than three degrees from the deviation card curve.

A comparison between the magnetic and gyro headings should be made at each course alteration and recorded in the Deck Log Book.

Some administrations require compass errors to be recorded in the Deck Log Book rather than a separate Compass Error Book.

Charts and publications:

4.13 Has a system been established to ensure that nautical publications and charts are on board and current?

A chart and publication management system is recommended to ensure that records are kept of the charts and publications carried and when they were last corrected. (BPG 4.9.1)

Note: Charts should be in good condition. The paper surface should be intact and charts should be replaced when torn, not taped together.

4.14 Are all paper and where applicable electronic charts, fully provided and corrected for the intended voyage?

All ships shall have nautical charts and publications to plan and display the ship's route for the intended voyage and to plot and monitor positions throughout the voyage; an electronic chart display and information system may be accepted as meeting this requirement. (SOLAS V/19.2.1.4)

Nautical charts and nautical publications, such as sailing directions, lists of lights, notices to mariners, tide tables and all other publications necessary for the intended voyage, shall be adequate and up to date (SOLAS V/27)

Notes: All the charts in use must be maintained fully corrected, using the Notices to Mariners of the hydrographic office which produced them. It is not satisfactory practice to correct charts using the corrections from another hydrographic office.

The standard of correction should be checked, to ensure that they have been carried out neatly, in the correct colours and that the correction is comprehensible.

Corrections can usually be obtained from local agents if for any reason mailed copies are significantly delayed.

Record keeping of corrections should be reviewed and random checks made to ensure that recorded corrections to charts and other nautical publications have been made and that charts and publications in use are fully corrected and up to date.

The last notice to mariners on board should be dated within the previous two months.

Notes relating to the specific use of electronic charts. *To use ECDIS as a stand-alone system without paper charts, two fully independent, IMO type-approved vector chart systems are required.*

Appraisal:

In addition to the paper publications necessary for a safe passage, the following issues should be taken into consideration for electronic passage planning:

- The vessel's controlling operational parameters (maximum draft, air draft, turning data, minimum under keel clearance required, 'look ahead' distance etc.) should be entered;
- The GPS position system input should be set to WGS 84 datum;
- The alarm functions of the ECDIS should be fully operational; they will alert the operator to any dangers exposed in good time during the voyage;
- The electronic chart coverage for the voyage must be adequate;
- The electronic charts must be fully corrected for the intended voyage. (SOLAS V/27)

Planning:

- Marking/highlighting of electronic charts can be carried out in a similar way to paper charts to identify radar conspicuous targets, no-go areas, parallel index lines (essential for the monitoring stage), transit marks, clearing bearings, etc.;
- It is prudent for a simulated passage to be run prior to the vessel's departure to ensure that the route does not enter any alarm preset danger areas that may have been overlooked;
- Estimated positions should be marked on the chart for each watch, in advance.

Execution and Monitoring:

Navigating officers must not become over-reliant on ECDIS. Frequent checks should be made of the ECDIS position fixing system (normally GPS) by the use of other means. Such checks should include:

- Parallel indexing and use of clearing bearings;
- Use of radar to check the accuracy of the charted position by comparing the location of the radar target against the charted symbol;
- Visual cross bearings;
- Comparison of the signal to noise ratio of the GPS system in use.

The full functionality of ECDIS cannot be achieved when operating in the raster chart display (RCDS) mode and thus the system should always be operated in ECDIS mode.

Data input from the gyro compass, speed log, echo sounder and other electronic equipment should be periodically monitored to ensure accuracy.

4.15 Were the charts used for the previous voyage appropriate?

Note: The largest scale charts published should be used. The master should have made every effort to obtain the necessary charts if the vessel is ordered to a port not covered by the chart folio system.

4.16 Are Lists of Lights, Tide Tables, Sailing Directions, the Nautical Almanac, the Annual Summary of Notices to Mariners and the Chart Catalogue the current editions and have they been maintained up to date where required?

Nautical charts and nautical publications, such as sailing directions, lists of lights, notices to mariners, tide tables and all other publications necessary for the intended voyage, shall be adequate and up to date.

(SOLAS V/27)

Navigation:

4.17 Has the vessel been safely navigated and in compliance with international regulations?

A ship shall use a mandatory ship's routing system and in accordance with the relevant provisions unless there are compelling reasons not to use a particular ships' routing system. Any such reason shall be recorded in the ship's log. (SOLAS V/10.7)

Note: Charts of at least the complete previous voyage should be checked to determine that the vessel has been safely navigated. The correct use of traffic separation zones, intervals between position fixes, maintenance of a safe distance off the coast, avoidance of prohibited areas and dangerous wrecks, adherence to printed notes on the charts, etc., will provide evidence of safe navigation.

4.18 Is the echo sounder recorder marked with a reference date and time on each occasion it is switched on?

Note: The echo sounder recorder should be switched on prior to each approach to shallow water and port entry and prior to departure and remain in operation while in shallow waters. The date and time of switching on should be marked on the recorder chart. In addition, the date and time of passing significant land or seamarks should be marked on the recorder. Many modern electronic echo sounders have an in-built 24-hour memory which can be recalled. If an electronic memory is not provided, the echo sounder should be provided with a printed record.

4.19 Is a look-out maintained at all times when the vessel is at sea?

Every vessel shall at all times maintain a proper look-out by sight and hearing as well as by all available means appropriate to the prevailing circumstances and conditions as to make a full appraisal of the situation and the risk of collision. (Colregs Rule 5)

The look-out must be able to give his full attention to the keeping of a proper look-out and no other duties shall be undertaken or assigned which could interfere with that task. (STCW A-VIII/2-3.1/14)

The officer in charge of the navigational watch may be the sole look-out in daylight provided that on each occasion:

- The situation has been carefully assessed and it has been established without doubt that it is safe to do so;
- Full account has been taken of all relevant factors including, but not limited to:
 - State of weather;
 - Visibility;
 - Traffic density;
 - Proximity of dangers to navigation; and
 - The attention necessary when navigating in or near traffic separation schemes;
- Assistance is immediately available to be summoned to the bridge when any change in the situation so requires. (STCW A-VIII/2-3.1/15)

It is of special importance that at all times the officer in charge of the navigational watch ensures that a proper look-out is maintained. In a ship with a separate chartroom the officer in charge of the navigational watch may visit the chartroom, when essential, for a short period for the necessary performance of navigational duties, but shall first ensure that it is safe to do so and that a proper look-out is maintained. (STCW A-VIII/2-3.1/32)

Note: A lookout should not leave the bridge during the watch as this contravenes the requirements of SOLAS and STCW. Rounds of the vessel should be conducted after the end of each watch.

4.20 Was a comprehensive passage plan available for the previous voyage and did it cover the full voyage from berth to berth?

Prior to proceeding to sea, the master shall ensure that the intended voyage has been planned using appropriate charts and publications for the area concerned. (SOLAS V/34 and IMO Res. A.893)

Notes: The passage plan should be completed by an officer and checked by the master.

Use of the UK Maritime and Coastguard Agency **Marine Guidance Note 166** (Guidelines for Voyage Planning) and the Nautical Institute publication **Bridge Team Management** reinforce the recommendations contained in the ICS **Bridge Procedures Guide**.

Passage planning should be carried out on the chart, although there is a place for the use of a conning notebook, or some information gathered elsewhere. Overcrowding of information in the working areas of the chart can be avoided by recording the information away from the track and drawing attention to it by a line or reference letter.

The following **should be marked on the chart**, where it enhances safe navigation:

- Parallel indexing (not from floating objects unless they have been first checked for position);
- Chart changes;
- Methods and frequency of position fixing;
- Prominent navigation and radar marks;
- No-go areas (the excessive marking of no-go areas should be discouraged – see below);
- Landfall targets and lights;
- Clearing lines and bearings;
- Transits, heading marks and leading lines;
- Significant tides or current;
- Safe speed and necessary speed alterations;
- Changes in machinery status;
- Minimum under keel clearance;
- Positions where the echo sounder should be activated;
- Crossing and high density traffic areas;
- Safe distance off;
- Anchor clearance;
- Contingency plans;
- Abort positions;
- VTS and reporting points, etc.,

Charted passage planning information should not obscure printed details, nor should the information on charts be obliterated by the use of highlight or felt-tip pen, red pencil, etc.

No-go areas should be highlighted, but should be reserved for those areas where the attention of the navigator needs to be drawn to a danger such as shallow water or a wreck close to the course line. Extensive use of no-go areas should be discouraged. No-go areas vary with change of draft and tide and will therefore also vary with the time of passage. They should not therefore be permanently marked.

All courses previous to the last voyage should have been erased. Course lines must not be marked in ink, although it is acceptable to plot alter course positions in ink where these are frequently in use.

4.21 Was position fixing satisfactory throughout the previous voyage and the frequency of plotted fixes in accordance with the passage plan?

Good navigational practice demands that the officer of the watch:

- *Understands the capabilities and limitations of the navigational aids and systems being used and continually monitors their performance;*
- *Uses the echo sounder to monitor changes in water depth;*
- *Uses dead reckoning techniques to check position fixes;*
- *Cross-checks position fixes using independent sources of information; this is particularly important when electronic position fixing systems such as GPS are used;*
- *Uses visual navigation aids to support electronic position-fixing methods i.e. landmarks in coastal areas and celestial navigation in open waters;*
- *Does not become over reliant on automated navigational equipment, including electronic chart systems, thereby failing to make proper navigational use of visual information. (BPG 3.3.1.2)*

The safe progress of the ship along the planned tracks should be closely monitored at all times. This will include regularly fixing the position of the ship, particularly after each course alteration. (BPG 3.3.3.4)

Notes: At least two methods of position fixing should be charted, where possible. Visual and radar position fixing and monitoring techniques should be used whenever possible. GPS derived positions should always be verified by alternative methods.

The frequency of position fixing should be such that the vessel cannot run into danger during the interval between fixes.

4.22 Was radar parallel indexing used to monitor the position of the vessel?

Note: Fixed points such as lighthouses and headlands should always be used in preference to floating objects, which should be carefully checked for position before being used for parallel indexing.

4.23 During pilotage, was the position of the vessel adequately monitored?

4.24 Has the GPS been adjusted to the correct datum?

Notes: GPS is referenced to WGS84 and it is recommended that the GPS receiver is maintained referenced to that datum. Hydrographic offices are gradually changing all charts to WGS84 and these charts include the legend "WGS84 positions can be plotted directly on this chart". Some charts contain information on latitude and longitude shift values that should be applied to GPS positions before they are charted. Occasionally these can be significant, and many charts still show the land or obstructions in the wrong position when compared with GPS data.

Accuracy of positions using GPS can be affected, amongst other things, by differences in datums, solar activity and powerful radar or radio transmissions, including deliberate jamming.

Discrepancies in charted positions of obstructions can also introduce significant differences between GPS derived positions and more traditional methods.

4.25 Is there an adequate system for dealing with navigation warnings and are they being charted?

Notes: A system should be in place for monitoring navigational warnings appropriate to the ship's trading area and for ensuring relevant navigational warnings are brought to the attention of the watchkeeping officers.

Such a system must include an adequate, up to date filing system for Temporary and Preliminary Notices, Navarea and Navtex warnings. Relevant warnings must be charted and the chart they have been entered on must be recorded on the warning notice in order that the warning can be removed when the notice is cancelled.

Navtex warnings should be monitored by the officer on watch at the time of receipt. He should ensure that the system is maintained by initialling the warnings received to show that they have been checked as to whether they are relevant to the current voyage. Those which are relevant should be charted.

Navigation equipment:**4.26 Is navigation equipment appropriate for the size of the vessel and in good order?**

Note: Regardless of whether a vessel is required by legislation to carry specific navigational equipment, if equipment is fitted then it should be operational. Such equipment may be a course recorder, off-course alarm, electronic chart display or engine order logger/printer. Make spot checks to ensure that equipment is operational.

The following applies to all vessels constructed (i.e. keel laid) before 1st July 2002.

(SOLAS 1974 V/12)

All ships, irrespective of size:

4.26.1	A receiver for a global navigation satellite system or terrestrial navigation radionavigation system. <i>Or other means, suitable for use at all times throughout the intended voyage to establish and update the ship's position by automatic means.</i> <i>(SOLAS 2004 V/19.1.2.2)</i>
4.26.2	A Navtex receiver. <i>Every ship shall be provided with a receiver capable of receiving international NAVTEX service broadcasts if the ship is engaged on voyages in any area in which an international NAVTEX service is provided.</i> <i>(SOLAS IV/7.1.4)</i> <i>Notes: The Navtex system broadcasts coastal warnings which cover the area from the fairway buoy out to about 250 miles from the transmitter, or occasionally up to 400 miles in unusual propagational conditions.</i> <i>Each Navtex message begins with ZCZC, followed by a space and four characters. The first, B₁, identifies the station, the second, B₂, the subject (i.e. navigation warning, weather forecast, gale warning, distress alert, etc.) and the third and fourth the consecutive number of the message from that station.</i> <i>The Navtex should be programmed to the stations for the area in which the vessel is sailing and to the type of B₂ messages which are required to be received. Message types A, B and D are mandatory, but it is recommended that the receiver be programmed to receive most types.</i>
4.26.3	A whistle, bell and gong. <i>A whistle and bell for vessels of 12 metres or more in length and a gong for vessels of 100 metres or more in length.</i> <i>(Colregs D/33.a)</i>
4.26.4	Shapes. <i>Three balls, a cylinder and a diamond shape should be carried.</i> <i>(Colregs)</i>

All ships of 150 gt and upwards:

4.26.5	A properly adjusted standard magnetic compass. <i>A spare magnetic compass, interchangeable with the standard magnetic compass, shall be carried unless a steering compass or gyro compass is fitted.</i> <i>The magnetic compass shall be properly adjusted and its table or curve of residual deviations shall be available at all times.</i>
4.26.6	A steering magnetic compass. <i>Unless heading information provided by the standard compass above is made available and is clearly readable by the helmsman at the main steering position.</i> <i>Spare magnetic compasses should be stored upside down to avoid wear of the needle bearing.</i>
4.26.7	Means for taking bearings. <i>As nearly as practicable over an arc of the horizon of 360°.</i>
4.26.8	A spare magnetic compass. <i>This should be interchangeable with the standard compass.</i> <i>A spare magnetic compass is not required if a steering compass or a gyro compass is fitted.</i>
4.26.9	A telephone. <i>Ships with emergency steering positions shall at least be provided with a telephone or other means of communication for relaying heading information.</i>
4.26.10	A daylight signalling lamp. <i>All ships of over 150 gt, when engaged on international voyages, shall have on board an efficient daylight signalling lamp which shall not be solely dependent on the ship's main source of electrical power.</i> <i>(SOLAS 1974 V/11)</i>

All ships of 300 gt and upwards on international voyages:

4.26.11	<p>An automatic identification system (AIS). <i>Ships fitted with AIS shall maintain AIS in operation at all times except where international agreements, rules or standards provide for the protection of navigational information.</i> <i>(SOLAS 2004 V/19.2.4.7)</i> <i>Note: If the AIS is not interfaced with either a radar or electronic chart display, it should be positioned adjacent to one of them.</i></p>
4.26.12	<p>A VHF radio. <i>All ships of 300 gt and upwards shall be provided with a VHF installation capable of transmitting and receiving on Channels 6, 13, 16 and 70 (DSC). It shall be possible to initiate the transmission of distress alerts on channel 70 from the position from which the ship is normally navigated.</i></p>

All ships of 500 gt and upwards:

4.26.13	<p>A gyro compass and repeaters. <i>A gyro compass shall be fitted on ships of 500 gt and upwards constructed on or after 1st September 1984 and on ships of 1,600 gt and upwards on international voyages.</i> <i>Ships of 1,600 gt and upwards shall be provided with a gyro repeater or repeaters suitably placed for taking bearings as nearly as practicable over the arc of the horizon of 360°.</i> <i>The master compass or a gyro repeater shall be clearly readable by the helmsman at the main steering position.</i></p>
4.26.14	<p>Visual compass readings to the emergency steering position. <i>Arrangements shall be provided for ships constructed on or after 1st February 1992.</i></p>
4.26.15	<p>A radar installation. <i>A radar capable of being operated in the 9 ghz (3 cm, 'X' band) shall be installed on ships of 500 gt and upwards constructed on or after 1st September 1984 and on ships of 1,600 gt and upwards constructed before 1st September 1984.</i> <i>However, ships of 10,000 gt and upwards shall be fitted with 2 radars, each being capable of being operated independently of the other and one of which must be capable of operating in the 9 ghz (3 cm, 'X' band).</i></p>
4.26.16	<p>Radar plotting equipment. <i>Facilities for plotting radar readings shall be provided on the navigation bridge of ships fitted with radars.</i> <i>In ships of 1,600 gt and upwards constructed after 1st September 1984 the plotting facilities shall be at least as effective as a reflection plotter.</i></p>
4.26.17	<p>An echo sounder. <i>When engaged on international voyages, ships of 500 gt and upwards constructed on or after 25th May 1980 and ships of 1,600 gt and upwards constructed before 25th May 1980 shall be fitted with an echo sounder.</i> <i>Performance of the echo sounder should be tested on all ranges and scales to verify recordings against depths shown on the chart.</i></p>
4.26.18	<p>A speed and distance indicator. <i>When engaged on international voyages ships of 500 gt and upwards constructed on or after 1st September 1984 shall be fitted with a device to indicate speed and distance.</i></p>
4.26.19	<p>Rudder angle, RPM, variable pitch and bow/stern thruster indicators. <i>Ships of 1,600 gt and upwards constructed before 1st September 1984 and all ships of 500 gt and upwards constructed on or after 1st September 1984 shall be fitted with indicators showing the rudder angle, the rate of revolution of each propeller and in addition, where fitted with variable pitch propellers or lateral thrust propellers, the pitch and operational mode of such propellers. All these indicators shall be readable from the conning position.</i></p>

All ships of 10,000 gt and upwards:

4.26.20	<p>Radar installations. <i>Two radar installations shall be provided, each capable of operating independently.</i> <i>At least one of the installations shall operate in the 9 ghz (3 cm, 'X' band).</i></p>
4.26.21	<p>An ARPA. <i>Tankers of 10,000 gt and upwards shall be fitted with an automatic radar plotting aid.</i></p>

	<i>Vessels required to be fitted with an ARPA shall be equipped with a device to indicate speed and distance through the water. (i.e. an electromagnetic or pitot log.) If the speed through the water log is not operational, the speed of the vessel must be entered manually.</i>
--	--

All ships of 100,000 gt and upwards:

4.26.22	A rate of turn indicator. <i>Required for vessels of 100,000 gt and upwards constructed after 1st September 1984.</i>
---------	--

The following applies to all vessels constructed (i.e. keel laid) after 1st July 2002. (SOLAS 2004 V/19)

All ships, irrespective of size:

4.26.23	A receiver for a global satellite navigation system or terrestrial navigation radionavigation system. <i>Or other means, suitable for use at all times throughout the intended voyage to establish and update the ship's position by automatic means.</i>
4.26.24	A Navtex receiver. <i>Every ship shall be provided with a receiver capable of receiving international NAVTEX service broadcasts if the ship is engaged on voyages in any area in which an international NAVTEX service is provided. (SOLAS IV/7.1.4)</i> <i>Notes: The Navtex system broadcasts coastal warnings which cover the area from the fairway buoy out to 250 miles from the transmitter, or occasionally up to 400 miles in unusual propagational conditions.</i> <i>Each Navtex message begins with ZCZC, followed by a space and four characters. The first, B₁, identifies the station, the second, B₂, the subject (i.e. navigation warning, weather forecast, gale warning, distress alert, etc.) and the third and fourth the consecutive number of the message from that station.</i> <i>The Navtex should be programmed to the stations for the area in which the vessel is sailing and to the type of B₂ messages which are required to be received. Message types A, B and D are mandatory, but it is recommended that the receiver be programmed to receive most types..</i>
4.26.25	A whistle, bell and gong. <i>A whistle and bell for vessels of 12 metres or more in length and a gong for vessels of 100 metres or more in length. (Colregs D/33.a)</i>
4.26.26	Shapes. <i>Three balls, one cylinder and one diamond shape should be carried. (Colregs)</i>
4.26.27	A properly adjusted magnetic compass. <i>Or other means independent of any power supply, to determine the ship's heading and display the reading at the main steering position.</i>
4.26.28	A pelorus or compass bearing device. <i>Or other means, independent of any power supply, to take bearings over an arc of the horizon of 360°.</i>
4.26.29	Means of correcting heading and bearings to true at all times.
4.26.30	A sound reception system. <i>Or other means, when the bridge is totally enclosed, to enable the officer in charge of the watch to hear sound signals and determine the direction.</i>
4.26.31	A telephone. <i>Or other means, to communicate heading information to the emergency steering position.</i>

All ships of 150 gt and upwards:

4.26.32	A spare magnetic compass. <i>Or other means, interchangeable with the magnetic compass in 4.26.27.</i>
4.26.33	A daylight signalling lamp. <i>All ships of 150 gt and upwards shall be fitted with a daylight signalling lamp, or other means, to communicate by light during day and night using an energy source of electrical power not solely dependent on the ship's power supply.</i>

All ships of 300 gt and upwards:

4.26.34	An echo sounding device.
---------	---------------------------------

4.26.35	A 9 ghz (3 cm 'X' band) radar.
4.26.36	An electronic plotting aid. <i>To plot electronically the range and bearing of targets to determine collision risk.</i>
4.26.37	A speed and distance measuring device. <i>To indicate speed and distance through the water. If the device is not operational, speed input to the ARPA, where fitted, must be manual.</i>
4.26.38	A properly adjusted transmitting heading device. <i>Or other means, to transmit heading information for input into the 9 ghz radar, the plotting aid and the speed and distance measuring device.</i>
4.26.39	A VHF radio. <i>All ships of 300 gt and upwards shall be provided with a VHF installation capable of transmitting and receiving on Channels 6, 13, 16 and 70 (DSC). It shall be possible to initiate the transmission of distress alerts on channel 70 from the position from which the ship is normally navigated.</i>

All ships of 300 gt and upwards on international voyages:

4.26.40	An automatic identification system (AIS). <i>Ships fitted with AIS shall maintain AIS in operation at all times except where international agreements, rules or standards provide for the protection of navigational information.</i> <i>(SOLAS V/19.2.4.7)</i> <i>Note: If the AIS is not interfaced with either a radar or electronic chart display, it should be positioned adjacent to one of them.</i>
---------	--

All ships of 500 gt and over:

4.26.41	A gyro compass. <i>Or other means, to determine and display the heading by shipborne non-magnetic means.</i>
4.26.42	A gyro compass heading repeater. <i>To supply heading information at the emergency steering position, if provided.</i>
4.26.43	A gyro compass bearing repeater. <i>To take bearings over an arc of the horizon of 360°.</i>
4.26.44	Rudder, propeller, thrust, pitch and operational mode indicators. <i>All to be readable from the conning position.</i>
4.26.45	An automatic tracking aid. <i>To plot automatically the range and bearing of other targets to determine collision risk.</i>

All ships of 3,000 gt and upwards:

4.26.46	A 3 ghz (10 cm, 'X' band) radar. <i>Or a second 9 ghz (3 cm, 'X' band) radar where considered appropriate by the administration.</i>
4.26.47	A second automatic tracking aid. <i>Functionally independent of the first automatic aid.</i>
4.26.48	A voyage data recorder. <i>There is no requirement for tankers constructed before 1st July 2002 to have a VDR.</i>

All ships of 10,000 gt and upwards:

4.26.49	An ARPA, equipped with speed through the water input. <i>An ARPA, or other means, to plot automatically the range and bearing of at least 20 other targets, connected to a device to indicate speed and distance through the water, to determine collision risks and simulate a trial manoeuvre.</i>
4.26.50	A heading or track control system. <i>To automatically control and keep to a heading and/or straight track.</i>

All ships of 50,000 gt and upwards:

4.26.51	A rate of turn indicator. <i>Or other means to determine and display the rate of turn.</i>
4.26.52	A speed and distance measuring device. <i>From 1st July 2002 new ships are to be equipped with a device to indicate speed and distance</i>

	<i>over the ground in the forward and athwartships direction.</i>
--	---

4.27 Are navigation lights in good order?

Note: Primary and secondary systems should be in good order, and there should be a procedure to check the navigation light failure alarm.

Additional comments:

If the Inspector has comments in respect of the subject matter covered by the Chapter additional to those which the Inspector may make in response to the specific key questions in the Chapter, the Inspector should include such additional comments in this section.

Chapter 5. Safety management

Notes: Where reference is made simply to SOLAS, these requirements apply to all vessels.

Where reference is made to SOLAS 2004, these requirements apply to vessels constructed after 1st July 2002.

Where reference is made to SOLAS 1974, this means SOLAS 74 as amended up to and including the 2001 Consolidated Edition and these requirements apply to vessels constructed before 1st July 2002.

The requirements of SOLAS 2001 Consolidated edition Chapter II-2 Part D (Fire safety measures for tankers) for vessels constructed before 1st July 2002 do not apply to tankers carrying only cargoes with a flashpoint above 60°C.

Safety management:

5.1 Has a safety officer been designated and trained to undertake this role?

Note: One of the primary functions of the safety officer, who preferably should be an experienced seafarer, is to inspect all areas of the vessel on a regular basis for safety compliance and to report any deficiencies noted. The purpose is to raise awareness, prevent accidents and to identify regular occurrences which might require the operator's intervention on a fleet-wide basis. The function of the safety officer may not involve equipment maintenance, although it does include identifying equipment deficiencies.

5.2 Are the ship's officers familiar with the operation of fire fighting, life saving and other emergency equipment?

Note: Ship's officers should be familiar with the operation of the fixed fire fighting systems, the main and emergency fire pumps, the emergency steering gear, the donning and use of breathing apparatus and oxygen resuscitation equipment

5.3 Is personal protective equipment such as boiler suits, safety footwear, eye and ear protection, safety harnesses and chemical protective equipment etc. provided and as required, being worn?

Note: Documented guidance relating to the use of this equipment should be provided.

5.4 Are all hand torches approved for use in gas-hazardous areas?

Note: Only flashlights that have been approved by a competent authority for use in flammable atmospheres must be used on board tankers. This includes torches in use on deck, in the engine room and those supplied for use with the firemen's outfits.

5.5 Are regular safety meetings held, are the minutes recorded and does the operator provide shore management responses?

5.6 Is there a procedure for the reporting, investigation and close-out of accidents, incidents, non-conformities and near misses?

Note: Port state inspection deficiencies should be recorded as non-conformities.

5.7 Is a completed ISGOTT Ship/Shore Safety Check List available and are its provisions being complied with?

Notes: The ISGOTT checklist may be used or alternatively a checklist provided by the terminal or the operator which is to an equivalent standard.

Any non-compliance should be recorded.

The letter 'R' against an item in the checklist indicates that it should be re-checked at intervals. There should be records to show that these items are being re-checked at the agreed intervals.

5.8 Are smoking regulations posted and being adhered to and are smoke rooms adequately identified?

Notes: Designated smoking areas should be agreed between the vessel and the terminal. Notices should be posted in public areas stating which the smoking areas for this particular port are, and each smoking area should be identified as such at the access to the area.

Smoking areas should be:

- *Restricted to locations within the accommodation or engine room;*
- *Should not have doors or ports that open directly on to open decks;*

All ports should be kept closed and doors into passageways should be kept closed except when in use. When stern loading/discharge connections are being used, care must be taken to ensure that no smoking is allowed in any accommodation or space the door or ports of which open on to the deck where the stern loading/discharge manifold is located. The use of all mechanical lighters and portable lighters with electrical ignition sources should be prohibited onboard tankers.

5.9 Are all required external doors, ports and windows kept closed in port?

Notes: A tanker's accommodation and machinery spaces contain equipment that is not suitable for use in flammable atmospheres and it is therefore important that petroleum gas is kept out of these spaces.

All doors, ports and similar openings should be closed when cargo operations are being conducted.

If doors have to be opened for access, they should be closed immediately after use. Where practical, a single door should be used for working access in port. Doors that must be kept closed should be clearly marked.

Allowance must be made to permit doors and openings to be open if the vessel is storing provided there is no possibility of gas entering the accommodation and that doors do not remain open for longer than is necessary.

5.10 Is the accommodation air conditioning system maintained on partial re-circulation during cargo operations?

Note: It is essential that the accommodation is kept under positive pressure to prevent the entry of hydrocarbon vapours. The operation of sanitary and galley extraction fans will cause a vacuum and therefore the air conditioning system intakes must not be kept fully closed.

5.11 Is all loose gear on deck, in stores and in internal spaces properly secured?

Drills, training and familiarisation:

Note: In accordance with the guidance in Chapter 2, drills involving relevant personnel should be carried out at regular intervals taking into account the ship type, personnel changes and any other relevant circumstances. Each drill should be as realistic as circumstances allow and there should be a review upon completion. Any action required to improve effectiveness should be noted and acted upon. Use of electronic interactive training aids can be beneficial, provided their use is structured and progress of individuals is monitored.

5.12 Is there a procedure for familiarisation for new personnel?

On-board training in the use of the ship's life-saving appliances, including survival craft equipment and in the use of the ship's fire extinguishing appliances shall be given as soon as possible but not later than two weeks after a crew member (first) joins a ship. (SOLAS III/19.4.1)

5.13 Are drills for emergency procedures being carried out?

Note: Emergency procedures should at least include collision, grounding, flooding, heavy weather damage, structural failure, fire (on deck and in cargo tanks, the engine room, pump room and accommodation), explosion, gas or toxic vapour release, critical machinery failure, rescue from enclosed spaces, serious injury, emergency towing equipment and helicopter operations.

5.14 Are lifeboat and fire drills regularly held?

Every crew member shall participate in at least one abandon ship drill and one fire drill every month. The drills of the crew shall take place within 24 hours of the ship leaving a port if more than 25% of the crew have not participated in abandon ship and fire drills on board that particular ship in the previous month. (SOLAS III/19.3.2)

Fire drills should be planned in such a way that due consideration is given to regular practice in the various emergencies that may occur depending on the type of ship and the cargo. (SOLAS III/19.3.4.1)

Crew members shall be trained to be familiar with the arrangements of the ship as well as the location and operation of any fire-fighting systems and appliances that they may be called upon to use.

(SOLAS 2001 III/19.4 and SOLAS 2004 II-2/15.2.2.1)

Each fire drill shall include:

- *Reporting to stations and preparing for the duties described in the muster list;*
- *Starting a fire pump, using at least the two required jets of water to show that the system is in proper working order;*
- *Checking of fireman's outfit and other personal rescue equipment;*

- *Checking of relevant communication equipment;*
- *Checking the operation of watertight doors, fire doors, fire dampers and main inlets and outlets of ventilating systems in the drill area; and,*
- *Checking the necessary arrangements for abandoning the ship.* (SOLAS III/19.3.4.2)

5.15 Is regular training in the use of life-saving equipment being undertaken?

Instructions in the use of the ship's fire extinguishing appliances, life-saving appliances and in survival at sea shall be given at the same interval as the drills. Individual instruction may cover different parts of the ship's life-saving and fire-extinguishing appliances, but all shall be covered within any period of two months. (SOLAS III/19.4.1)

Every crew member shall be given instructions which shall include but not necessarily be limited to:

- *Operation and use of the ship's inflatable liferafts;*
- *Problems of hypothermia, first-aid treatment for hypothermia and other appropriate first-aid procedures;*
- *Special instructions necessary for use of the ship's life-saving appliances in severe weather and severe sea conditions; and,*
- *Operation and use of fire-extinguishing appliances.* (SOLAS III/19.4.2)

As far as is reasonable and practicable, rescue boats other than lifeboats which are also rescue boats, shall be launched each month with their assigned crew aboard and manoeuvred in the water. In all cases this requirement shall be complied with at least every three months. (SOLAS III/19.3.3.6)

On board training in the use of davit-launched liferafts shall take place at intervals of not more than four months on every ship fitted with such appliances. (SOLAS III/19.4.3)

5.16 Are pollution clean-up drills regularly held to determine that the shipboard pollution plan is up-to-date and efficient and are there records?

Notes: Drills in accordance with the requirements of the SOPEP or SMPEP should be held at regular intervals.

On vessels carrying noxious liquids, drills should also be regularly carried out in dealing with chemical spills.

Ship security:

Notes: The International Ship and Port Facility Security Code came into force on 1st July 2004.

Inspectors should not request to sight sensitive material, only to confirm with the master that procedures or records are available or maintained.

5.17 Are ship security records related to port calls being maintained?

The ship shall keep records for the last ten calls at port facilities. (SOLAS XI-2/9.2.3)

Note: The required detail of the records is considerable and is contained in SOLAS XI-2/9.2.1.

5.18 Are ship security records related to the ship security plan being maintained?

Records should include:

- *Training, drills and exercises;*
- *Security threats and security incidents;*
- *Breaches of security;*
- *Changes in security level;*
- *Communications relating to the direct security of the ship such as specific threats to the ship or to port facilities the ship is, or has been, in;*
- *Internal audits and reviews of security activities;*
- *Periodic review of the ship security plan;*
- *Implementation of any amendments to the plan;*
- *Maintenance, calibration and testing of any security equipment provided on board, including testing of the ship security alert system.* (ISPS Code Part A/10.1)

5.19 Has the operator furnished the master with the information required by the ISPS Code?

The operator should ensure that the master has available on board, at all times, information which can establish:

- *Who is responsible for appointing the members of the crew or other persons currently employed or engaged on board the ship;*
- *Who is responsible for deciding the employment of the ship; and,*
- *In cases where the ship is employed under the terms of charter party(ies), who are the parties to such charter party(ies).* (SOLAS XI-2/5)

The information should reflect the condition as of 1st July 2004 and the operator is obliged to update and keep this information current as and when changes occur. (ISPS Code Part B 6.2 and 6.4)

5.20 Has a ship security officer been designated?

The duties and responsibilities of the ship security officer shall include, but are not limited to:

- Undertaking regular security inspections of the ship to ensure that appropriate security measures are maintained;
- Maintaining and supervising the implementation of the ship security plan, including any amendments to the plan;
- Co-ordinating the security aspects of the handling of cargo and ship's stores with other shipboard personnel and with the relevant port facility security officers;
- Proposing modifications to the ship security plan;
- Reporting to the operator security officer any deficiencies and non-conformities identified during internal audits, periodic reviews, security inspections and verifications of compliance and implementing any corrective actions;
- Enhancing security awareness and vigilance on board;
- Ensuring that adequate training has been provided to shipboard personnel, as appropriate;
- Reporting all security incidents;
- Co-ordinating implementation of the ship security plan with the operator security officer and the relevant port facility security officer; and,
- Ensuring that security equipment, if any, is properly operated, tested, calibrated and maintained.

(ISPS Code Part A/12.2)

5.21 Has the ship security officer received adequate training?

Note: The suggested training is detailed in the ISPS Code Part B/13.1 and 2 and includes adequate knowledge of the ship and of the ship security plan and related procedures.

5.22 Is an adequate deck watch being maintained to prevent unauthorised access?

Note: The deck watch should ensure that access to the ship is denied to all unauthorised persons.

5.23 Has a gangway notice been posted, at the shore end of the access where possible?

Note: The notice should at least state that:

- Unauthorised persons are not allowed to board;
- Visitors are required to show identification;
- Mobile phones and other electronic equipment must be switched off;
- Smoking and naked lights are prohibited;
- Lighters and matches are prohibited to be carried on board.

Enclosed space, pump room and Volatile Organic Compound compartment entry procedures:

Notes: An enclosed space is one which has limited access openings and natural ventilation and includes, but is not limited to, cargo spaces, double bottoms, fuel tanks, ballast tanks, pump rooms, cofferdams, void spaces, duct keels, inter-barrier spaces, engine crankcases and sewage tanks.

Pump room entry requires its own particular precautions.

Cargo tanks should not be entered unless they have been cleaned. Cargo tanks may be cleaned solely by ventilation after the carriage of certain cargoes. In these circumstances, there should be clear evidence of proper risk assessment being conducted prior to entry.

5.24 Are enclosed space entry procedures in accordance with the recommendations of ISGOTT?

Notes: In order to simplify the administrative process all cargo tanks which have been tested and found to be safe for entry may be shown on one permit, but the permit must record the readings for each compartment and the same entry procedures must be applied for each compartment entered.

Under such circumstances compartments should be tagged to indicate which are safe to enter and which are not and rigorous control must be in place to ensure that permits are cancelled and the tags changed when entry has been completed.

To be considered safe for entry a reading of not more than 1% LFL must be obtained on suitable monitoring equipment.

Entry into a compartment which has not been cleaned or proved safe for entry must only be considered in an emergency situation. The operator should be involved in any decision to enter such a compartment.

The use of personal analysers capable of continuously monitoring the oxygen content of the atmosphere, the presence of hydrocarbon vapour and, if appropriate, toxic vapour is strongly recommended.

5.25 Are pump room entry procedures being complied with?

Notes: Pump rooms should be considered enclosed spaces but because of the need for personnel to routinely enter them, the fact that cargo pumps and lines may contain petroleum and because they are subject to continuous ventilation, special precautions are necessary.

Operators may choose to use an enclosed space entry permit, modified for the purposes of controlling pump room entry. In such cases, it must be established that the ship's personnel clearly understand the additional dangers associated with pump rooms and are not merely using the document as a means to satisfy the requirements of an inspection.

Procedures should be in place to control pump room entry, including the checking of the atmosphere and it is recommended that personal hydrocarbon analysers are used during every entry.

A notice should be displayed at the pumproom entrance detailing the entry requirements.

5.26 Are pump room spaces adequately ventilated?

Cargo pump rooms shall be mechanically ventilated and discharges from the exhaust fans shall be led to a safe place on deck. The ventilation of these rooms shall have sufficient capacity to minimise the possibility of accumulation of flammable vapours. The number of changes of air shall be at least 20 per hour. The ventilation shall be of the suction type using fans of non-sparking type. (SOLAS II-2/4.5.4.1)

In addition to the above on vessels constructed after 1st July 2002: The air ducts shall be arranged so that all of the space is effectively ventilated. (SOLAS 2004 II-2/4.5.4.1)

On vessels constructed after 1st July 2002, lighting in cargo pump-rooms, except emergency lighting, shall be interlocked with ventilation such that that the ventilation shall be in operation when switching on the lighting. Failure of the ventilation system shall not cause the lighting to go out. (SOLAS 2004 II-2/4.5.10.1.2)

Notes: On some older vessels the pump room ventilation system has been designed to operate with one fan on supply and the other on extraction. Nevertheless, there should be extraction from both sides of the pump room bilge area.

If such arrangements exist, this should be recorded in the comments.

If there is only one extraction fan, there should be alternative arrangements available to re-establish extraction in case of failure, such as a spare motor, or the ability to reverse the polarity of a supply fan.

5.27 Are pump room fire and flooding dampers clearly marked as to their operation and in good order?

Note: Often the venting system is fitted with high level suctions at or above the bottom gratings, the flaps of which are operable from the pump room top. The purpose of these suctions is to allow the fans to be operated when the bilges are flooded and the flaps should, under normal operations, be closed.

5.28 Is a permanent arrangement provided for lifting an unconscious person from the pump room, including provision of a suitable stretcher or harness and is it in good order?

Note: Cargo and ballast pump room rescue harness equipment should be checked regularly to ensure it is fit for use and rigged for immediate operation.

Monitoring non-cargo spaces:

Note: Void and ballast tank spaces within the cargo tank block should be routinely monitored to check that no leakage has occurred from adjacent cargo tanks. Monitoring should include regular checks for hydrocarbon content and regular sounding/ullaging of the empty spaces, particularly to ensure that ballast, before it is discharged, is clean.

5.29 Are spaces adjacent to cargo tanks, including pipe ducts, regularly monitored for accumulations of gas?

Note: There should be a procedure for the regular monitoring of all spaces adjacent to the cargo tanks for accumulations of gas. If monitoring is made by use of portable instruments, the method, frequency of checking and adequacy of records should be established.

5.30 Where a fixed system to monitor flammable atmospheres in non-cargo spaces is fitted, are recorders and alarms in order?

Note: If manual checks are made, the records should be reviewed. Manufacturers' instructions for the maintenance of the system should be being followed.

Gas analysing equipment:

5.31 Are portable gas and oxygen analysers appropriate to the cargoes being carried and are they in good order?

Suitable portable instruments for measuring oxygen and flammable vapour concentrations shall be provided. (SOLAS 1974 II-2/59.4.4.1)

For ships constructed after 1st July 2002: Tankers shall be equipped with at least one portable instrument for measuring flammable vapour concentrations, together with a sufficient set of spares. Suitable means shall be provided for the calibration of such instruments. (SOLAS 2004 II-2/4.5.7.1)

Notes: Each vessel should carry at least two each oxygen, % volume hydrocarbon, LEL and toxic gas analysers.

Personal oxygen and hydrocarbon analysers, which can be carried in a pocket or on a belt, should be available for tank, enclosed space or pump room entry.

5.32 Are officers familiar with use and calibration of portable oxygen and hydrocarbon analysers?

Notes: A procedure must require that all oxygen and hydrocarbon analysers are checked for correct operation before each use. Nitrogen must generally be used when calibrating oxygen analysers, but some multiple function analysers use a test gas which serves all the functions of the analyser with one sample gas and which has an oxygen content of 20.9%.

In the case of hydrocarbon gas analysers, the correct test gas specified in the manufacturers' documentation must be used and officers must know what the result of using that test gas should be. This applies to each type of analyser on board. As above, some multiple function analysers use a test gas which tests all the functions with one sample gas.

5.33 Is there a record of regular testing and calibration of portable analysers?

Notes: The manufacturers' recommended intervals for servicing the equipment ashore must be being adhered to and there must be a routine for the replacement of parts on board, such as filters, at the intervals recommended by the manufacturers.

It should be noted that the use of a self test facility does not necessarily mean that an analyser is operating correctly. It is possible for various reasons for a machine to satisfactorily self-test, but then fail to register a lack of oxygen or the presence of gas. The only way to be sure that a machine is operating satisfactorily is to use a sample check gas.

5.34 Is sufficient span calibration gas available for the types of fixed and portable analysers on board?

5.35 Are instruments capable of measuring hydrocarbon content in an oxygen deficient atmosphere available, if required and in good order?

Notes: Vessels equipped with inert gas should in addition to the analysers in question 5.31 carry two analysers capable of measuring hydrocarbon content in an inert atmosphere.

Personnel should be aware whether or not the analyser being used for measuring hydrocarbon content in an inert gas atmosphere is in fact capable of doing so accurately. An example of an analyser specifically designed to do so is the MSA Tankscope.

5.36 Where toxic gases may be encountered, are appropriate toxic gas detection analysers available and in good order?

Notes: The use of personal H₂S gas monitoring instruments for personnel engaged in cargo operations is strongly recommended.

Two toxic gas detectors are required on vessels carrying noxious liquids.

There should be an adequate supply of tubes (e.g. Draeger tubes), specific to the cargoes being carried and they should be within their expiry date.

An up to date inventory of tubes should be being maintained.

H₂S is likely to be encountered with many cargoes, including naphtha, fuel oil, bunker fuels, bitumen and gas oils and a suitable analyser should be available which should be regularly tested in accordance with the procedures above.

Personnel should be aware that some instrument sensors could be poisoned if exposed to high concentrations of CO₂.

Hot work procedures:**5.37 Are hot work procedures in accordance with the recommendations of ISGOTT?**

Notes: The recommendations of ISGOTT with respect to hot work should be followed.

Hot work should only be considered if there is no practical alternative means of repair, and consideration should be given to removing the work to a safe area such as the engine room workshop.

Whenever hot work is to take place outside the engine room workshop the decision to carry out the hot work should involve the company.

5.38 Is electric welding equipment in good order and are written safety guidelines available on site?**5.39 Is gas welding and burning equipment in good order?****5.40 Is fixed piping installed from the gas cylinders to the operating position?**

Note: Piping should be of steel welded construction. Copper, rubber or braided lines should not be used, except that braided lines may be used for the short length from the cylinder heads to the manifolds within the storage space. Pipework and fittings should be free of grease.

5.41 Are flashback arresters fitted at the work station and are they in good order?

Note: Flashback arresters should be fitted at the workstation, but may, in addition also be fitted at the cylinders.

5.42 Are spare oxygen and acetylene cylinders stored apart in a dedicated storage and is the storage in a clearly marked, well-ventilated position outside the accommodation and engine room?

Notes: Oxygen will not burn or explode, it only supports combustion; however, a small amount of excess oxygen will allow materials which are not normally combustible to burn with ferocity. Oxygen cylinders are painted black.

Acetylene is 92.3% carbon and 7.7% hydrogen, is lighter than air and is highly flammable with a LEL of 2.5%. Acetylene cylinders are painted maroon.

There is no specific requirement for the separation of cylinders, but both industry and governmental organisations recommend it. The storage should be well ventilated and away from any heat source. A hazard warning notice should be clearly displayed outside. Cylinders should be kept upright and should be properly secured. Protective caps should be secured on cylinders not in use. In-use cylinders may be stored in the same compartment but separated at a distance of not less than 1 metre. Cylinder valves should be closed when not in use.

Life-saving equipment:

Before the ship leaves port and at all times during the voyage, all life-saving appliances shall be in working order and ready for immediate use. (SOLAS III/20.2)

*Note: The technical specifications and requirements for life-saving appliances are contained in the **Life-Saving Appliances Code**.*

5.43 Are ship-specific life-saving equipment training manuals available?

A training manual shall be provided in each crew mess room and recreation room, or in each cabin.

(SOLAS III/35.2)

The training manual shall contain instructions and information, in easily understood terms illustrated wherever possible, on the life-saving appliances provided in the ship and on the best methods of survival. Any part of such information may be provided in the form of audio-visual aids in lieu of the manual.

(SOLAS III/35.3)

The following shall be explained in detail:

- *Donning of lifejackets, immersion suits and anti-exposure suits;*
- *Muster at assigned stations;*
- *Boarding, launching and clearing the survival craft and rescue boats;*
- *Method of launching from within survival craft;*
- *Release from launching appliances;*
- *Illumination in launching areas;*
- *Use of all survival equipment;*
- *With the assistance of illustrations, the use of radio life-saving appliances;*

- Use of drogues;
- Use of engine and accessories;
- Recovery of survival craft and rescue boats, including stowage and securing;
- Hazards of exposure and the need for warm clothing;
- Best use of survival craft facilities in order to survive;
- Methods of retrieval, including the use of helicopter gear;
- All other functions contained in the muster list and emergency instructions; and
- Instructions for repair of the life saving appliances. (SOLAS III/35.3)

5.44 Are ship-specific life-saving equipment maintenance instructions available and are weekly and monthly inspections being carried out?

Inspection of the life-saving appliances, including lifeboat equipment, shall be carried out monthly using the checklist required by regulation 36.1 to ensure that they are complete and in good order. A report of the inspection shall be entered in the log-book. (SOLAS III/20.7)

Instructions for on-board maintenance shall be easily understood, illustrated wherever possible and as appropriate, shall include for each appliance:

- A checklist for use when carrying out the monthly inspections required by SOLAS III/20.7 and III/36.1;
- Maintenance and repair instructions;
- A schedule of periodic maintenance;
- A diagram of lubrication points with the recommended lubricants;
- A list of replaceable parts;
- A list of sources of spare parts; and
- A log for records of inspections and maintenance. (SOLAS III/36)

The following tests and inspections shall be carried out weekly:

- All survival craft, rescue boats and launching appliances shall be visually inspected to ensure that they are ready for use;
- All engines in lifeboats and rescue boats shall be run for a total period of not less than 3 minutes, provided the ambient temperature is above the minimum temperature required for starting and running the engine. During this period of time, it should be demonstrated that the gear box and gear box train are engaging satisfactorily;
- The general emergency alarm system shall be tested. (SOLAS III/20.6)

5.45 Are muster lists and lifejacket donning instructions displayed?

Muster lists and emergency instructions shall be exhibited in conspicuous places throughout the ship including the navigation bridge, engine room and crew accommodation spaces. (SOLAS III/8.3)

The muster list shall show the duties assigned to the different members of the crew including:

- Closing of the watertight doors, fire doors, valves, scuppers, sidescuttles, portholes and other similar openings in the ship;
- Equipping of the survival craft and other life-saving appliances;
- Preparation and launching of survival craft;
- General preparations of other life-saving appliances;
- Muster of passengers;
- Use of communication equipment;
- Manning of fire parties assigned to deal with fires; and
- Special duties assigned in respect to the use of fire-fighting equipment and installations. (SOLAS III/37.3)

The muster list shall specify which officers are assigned to ensure that life-saving and fire appliances are maintained in good condition and ready for immediate use. (SOLAS III/37.4)

The muster list shall specify substitutes for key persons who may become disabled, taking into account that different emergencies may call for different actions. (SOLAS III/37.5)

The muster list shall be prepared before the ship proceeds to sea. (SOLAS III/37.7)

5.46 Is there a maintenance and test schedule for lifeboat on-load release gear?

Lifeboat on-load release gear shall be serviced at recommended intervals, subjected to a thorough examination and test during the annual and renewal Safety Equipment Certificate surveys and shall be operationally tested under a load of 1.1 times the total mass of the lifeboat when loaded with its full complement of persons and equipment whenever the release gear is overhauled. Such overhauling and test shall be carried out at least once every five years. (SOLAS III/20.11.2)

Note: Of particular importance in the checking of lifeboats is the on-load release system fitted to enclosed lifeboats and the maintenance routines for them. A high percentage of accidents at sea are attributed to lifeboats and their release systems.

5.47 Are lifeboats, including their equipment and launching mechanisms, in good order?

Each survival craft shall be stowed in a state of continuous readiness so that two crew members can carry out preparations for embarkation and launching in less than 5 minutes. (SOLAS III/13.1.3)

Each lifeboat shall be launched with its assigned operating crew aboard and manoeuvred in the water at least once every three months during an abandon ship drill. (SOLAS III/19.3.3.3)

Lowering into the water, rather than launching of a lifeboat arranged for free-fall launching, is acceptable where free-fall launching is impracticable provided the lifeboat is free-fall launched with its assigned operating crew aboard and manoeuvred in the water at least once every six months. However, in cases where it is impracticable, the administration may extend this period to twelve months provided that arrangements are made for simulated launching which will take place at intervals of not more than six months. (SOLAS III/19.3.3.4)

Emergency lighting for mustering and abandonment shall be tested at each abandon ship drill. (SOLAS III/19.3.3.9)

Falls used in launching shall be turned end for end at intervals of not more than thirty months and be renewed when necessary due to deterioration, or at intervals of not more than five years, whichever is the earlier. (SOLAS III/20.4.1)

The administration may accept in lieu of the "end for ending" required in paragraph 4.1, periodic inspection of the falls and their renewal whenever necessary due to deterioration or at intervals of not more than four years, whichever one is earlier. (SOLAS III/20.4.2)

Each free-fall lifeboat shall be fitted with a release system which shall be designed to test the release system without launching the lifeboat. (LSA Code IV/4.7.6.4)

Each lifeboat shall be clearly marked with the number of persons for which the lifeboat is approved and the name and port of registry. Means of identifying the ship to which the lifeboat belongs and the number of the lifeboat shall be marked in such a way that they are visible from above. (LSA Code IV/4.4.9)

Notes: It is very important to check the lifting hooks and their associated structure, in particular the connections to the lifeboat keel. These are occasionally found to be severely wasted.

Lifeboat equipment is detailed in the LSA Code IV/4.4.8 and the general requirements for enclosed lifeboats in the LSA Code IV/4.6, although under SOLAS III/32.3.5 the totally enclosed lifeboats carried on ships constructed before 1st July 1986 need not comply with the requirements of the LSA Code IV/4.6.

Amendments to SOLAS III/19 and 20 which are expected to come into force on 1st July 2006 will introduce changes to the operational tests to be conducted during the weekly and monthly inspections so as not to require the assigned crew to be on board in all cases.

5.48 Are lifeboat and liferaft operating instructions displayed?

Posters or signs shall be provided on or in the vicinity of survival craft and their launching controls shall:

- Illustrate the purpose of the controls and the procedures for operating the appliance and give relevant instructions or warnings;*
- Be easily seen under emergency lighting conditions; and*
- Use symbols in accordance with resolution A.760, as amended by MSC.82. (SOLAS III/9.2)*

5.49 Is the rescue boat, including its equipment and launching arrangement, in good order?

Cargo ships shall carry at least one rescue boat. A lifeboat may be accepted as a rescue boat, provided that it also complies with the requirements for a rescue boat. (SOLAS III/31.2)

Rescue boats shall be stowed in a state of continuous readiness for launching in not more than 5 minutes. (SOLAS III/14.1)

Notes: Rescue boat equipment is detailed in the LSA Code V/5.1.2.2, 3 and 4.

With respect to launching equipment, rescue boats should comply with the requirements of the LSA Code 4.4.7.6 (by LSA Code 5.1.1.1) and either have two release capabilities, one off-load and one on-load, or only one if the rescue boat can only be released when waterborne.

The on-load release shall be:

- Protected against accidental or premature use;*
- To prevent a premature on-load release, on-load operation of the release mechanism should require a sustained and deliberate action by the operator;*
- To prevent an accidental release the mechanical protection (interlock) should only engage when the release mechanism is properly and completely set;*

47

- The release mechanism shall be so designed that crew members in the lifeboat can clearly observe when the release mechanism is properly and completely reset;
- Clear operating instructions should be provided with a suitable worded warning notice;
- Where a single fall or hook system is used for launching, the above requirements need not apply and a single capability to release the rescue boat only when it is waterborne will be adequate.

5.50 Are liferafts in good order?

Cargo ships shall carry one or more inflatable or rigid liferafts, stowed in a position providing for easy side-to-side transfer at a single open deck level and of such aggregate capacity as will accommodate the total number of persons on board. If not stowed in a position providing for easy side-to-side transfer at a single open deck level, the total capacity available on each side shall be sufficient to accommodate the total number of persons on board. (SOLAS III/31.1.2)

If a free-fall lifeboat is fitted, cargo ships shall have one or more inflatable or rigid liferafts, on each side of the ship, of such aggregate capacity as will accommodate the total number of persons on board. The liferafts on at least one side of the ship shall be served by launching appliances.

(SOLAS III/31.1.2.2)

For davit launched liferafts, the launching appliance shall include an automatic release hook arranged so as to prevent premature release during lowering and shall release the liferaft when waterborne. The release hook shall include a capability to release the hook under load. The on-load release control shall:

- Be clearly differentiated from the control which activates the automatic release function;
- Require at least two separate actions to operate;
- Be designed such that crew members on deck can clearly observe when the release mechanism is properly and completely set.

(LSA Code VI/6.1.5)

5.51 Are hydrostatic releases, where fitted, correctly attached and in good order?

Every liferaft shall be stowed with its painter permanently attached to the ship. (SOLAS III/13.4.1)

Each liferaft or group of liferafts shall be stowed with a float-free arrangement so that each floats free and if inflatable, inflates automatically when the ship sinks. (SOLAS III/13.4.2)

Liferafts shall be so stowed as to permit manual release of one raft or container at a time from their securing arrangements. (SOLAS III/13.4.3)

Note: Hydrostatic release manufacturers recommend that each liferaft is fitted with its own individual hydrostatic release, to prevent the possibility, where more than one liferaft is utilising the same release, of one of the liferafts breaking the weak link before the second or subsequent liferafts have inflated.

5.52 Are survival craft portable VHF radios and Search and Rescue Radar Transponders (SART's) in good order and charged?

At least 3 two-way VHF radiotelephone apparatus shall be provided on every cargo ship of 500 gross tonnage and upwards. (SOLAS III/6.2.1.1)

The two-way radiotelephone should be capable of operation on the frequency 156.800 MHz (VHF channel 16) and on at least one additional channel. (Res. A.890/3.1)

The source of energy should be integrated in the equipment and may be replaceable by the user. In addition, provision may be made to operate the equipment using an external source of electrical energy. (Res. A.890/12.1)

Equipment for which the source of energy is intended to be user-replaceable should be provided with a dedicated primary battery for use in the event of a distress situation. This battery should be equipped with a non-replaceable seal to indicate that it has not been used. (Res. A.890/12.2)

Equipment for which the source of energy is intended to be non-user-replaceable should be provided with a primary battery. The portable two-way radiotelephone equipment should be fitted with a non-replaceable seal to indicate that it has not been used. (Res. A.890/12.3)

At least one radar transponder shall be carried on each side of every cargo ship of 500 gross tonnage and upwards. The radar transponders shall be stowed in such locations that they can be rapidly placed in any survival craft (other than the forward liferaft). On ships equipped with free-fall lifeboats, one of the transponders shall be stowed in the free-fall lifeboat and the other located in the immediate vicinity of the navigation bridge so that it can be utilised on board and ready to transfer to any other survival craft.

(SOLAS III/6.2.2)

Note: The requirements for survival craft two-way VHF radios are contained in IMO Res. A.809(19).

5.53 Are lifebuoys, lights, buoyant lines, quick release mechanisms and self-activating smoke floats in good order?

Cargo ships shall carry not less than the following numbers of lifebuoys:

- Under 100 metres in length – 8;
- Between 100 metres and under 150 metres – 10;
- Between 150 metres and under 200 metres – 12;
- 200 metres and over – 14. (SOLAS III/32.1.1)

Lifebuoys shall be:

- So distributed as to be readily available on both sides of the ship and as far as practicable on all open decks extending to the ship's side;
- At least one shall be placed in the vicinity of the stern; and
- So stowed as to be capable of being rapidly cast loose and not permanently secured in any way. (SOLAS III/7.1.1)

At least one lifebuoy on each side of the ship shall be fitted with a buoyant line, equal in length to not less than twice the height at which it is stowed above the waterline in the lightest seagoing condition, or 30 metres, whichever is the greater. (SOLAS III/7.1.2)

Not less than one half of the total number of lifebuoys shall be provided with self-igniting lights;

Not less than two of these shall also be provided with lifebuoy self-activating smoke signals capable of quick release from the navigating bridge;

Lifebuoys with lights and those with lights and smoke signals shall be distributed equally on both sides of the ship and shall not be the lifebuoys provided with lifelines. (SOLAS III/7.1.3)

Lifebuoys intended to operate the quick-release arrangement provided for the self-activated smoke signals and self-igniting lights shall have a mass sufficient to operate the quick release arrangement. (LSA Code II/2.1.1.7)

5.54 Are lifejackets in good order?

A lifejacket shall be provided for every person on board and, in addition, a sufficient number of lifejackets shall be carried for persons on watch and for use at remotely located survival craft stations. The lifejackets carried for persons on watch should be stowed on the bridge, in the engine control room and at any other manned watch station. (SOLAS III/7.2.1)

The lifejackets used in totally enclosed lifeboats, except free-fall lifeboats, shall not impede entry into the lifeboat or seating. (SOLAS III/7.2.3)

Lifejackets selected for free-fall lifeboats and the manner in which they are carried or worn, shall not interfere with entry into the lifeboat, occupant safety or operation of the lifeboat. (SOLAS III/7.2.4)

5.55 Are immersion suits, where required, in a satisfactory condition?

Cargo ships shall carry for each lifeboat on the ship at least three immersion suits, or, if the administration considers it necessary and practicable, one immersion suit for every person on board the ship. Immersion suits are not required if totally enclosed lifeboats are fitted. (SOLAS III/32.3.2)

An immersion suit or an anti-exposure suit, of an appropriate size, shall be provided for every person assigned to crew the rescue boat. (SOLAS III/7.3)

Note: Amendments to SOLAS III/32 which are expected to come into force on 1st July 2006 will require immersion suits to be carried for each person on board.

5.56 Are pyrotechnics, including line throwing apparatus, in date and in good order?

Not less than 12 rocket parachute flares shall be carried and be stowed on or near the navigation bridge. (SOLAS III/6.3)

A line throwing appliance (including not less than four projectiles, four lines and brief instructions or diagrams) shall be provided. (SOLAS III/18)

An illustrated table describing the life-saving signals shall be readily available to the officer of the watch. (SOLAS V/29)

5.57 Are the locations of life saving appliances marked with IMO symbols?

Containers, brackets, racks and other similar stowage locations for life-saving equipment shall be marked with symbols in accordance with IMO Res. A.760(18). If more than one device is stowed in that location, the number of devices shall also be indicated. (SOLAS III/20.10)

Fire fighting equipment:

Fire fighting systems and appliances shall be kept in good working order and readily available for immediate use. (SOLAS II-2/14.2.1.2)

5.58 Are ship-specific fire training manuals available?

The training manual shall explain the following in detail:

- General fire safety practice and precautions related to the dangers of smoking, electrical hazards, flammable liquids and similar common shipboard hazards;
- General instructions on fire-fighting activities and fire-fighting procedures, including procedures for notification of a fire and use of manually operated call points;
- Meanings of the ship's alarms;
- Operation and use of fire-fighting systems and appliances;
- Operation and use of fire doors;
- Operation and use of fire and smoke dampers; and
- Escape systems and appliances. (SOLAS II-2/15.2.3.4)

A training manual shall be provided in each crew mess room and recreation room, or in each crew cabin. (SOLAS II-2/15.2.3.1)

The training manual shall be written in the working language of the ship. (SOLAS II-2/15.2.3.2)

5.59 Are ship-specific fire safety operational booklets available?

The fire safety operational booklet shall contain the necessary information and instructions for the safe operation of the ship and cargo handling operations in relation to fire safety. The booklet shall include information concerning the crew's responsibilities for the general fire safety of the ship while loading and discharging cargo and while under way. The booklet shall also provide reference to the pertinent fire-fighting and emergency cargo handling instructions contained in the IBC Code, the IGC Code and the IMDG Code, as appropriate. (SOLAS II-2/16.2.1)

It shall also include provisions for preventing fire spread to the cargo area due to ignition of flammable vapours and include procedures for cargo tank gas-purging and/or gas-freeing. (SOLAS II-2/16.3.1)

The fire safety operational booklet shall be provided in each crew mess room and recreation room, or in each crew cabin. (SOLAS II-2/16.2.2)

The booklet shall be written in the working language of the ship. (SOLAS II-2/16.2.3)

The booklet may be combined with the fire training manual. (SOLAS II-2/16.2.4)

5.60 Are ship-specific fire fighting equipment maintenance instructions available and are weekly and monthly inspections being carried out?

Maintenance, testing and inspections shall be carried out based on the guidelines in MSC/Circ.850

The maintenance plan shall be kept on board the ship and shall be available for inspection. The plan may be computer-based. (SOLAS II-2/14.2.2.2 and 4)

The maintenance plan shall include at least the following:

- Fire mains, fire pumps and hydrants, hoses, nozzles and international shore connections;
- Fixed fire detection and fire alarm systems;
- Fixed fire extinguishing systems and other fire extinguishing appliances;
- Automatic sprinkler, fire detection and fire alarm systems;
- Ventilation systems, including fire and smoke dampers, fans and their controls;
- Emergency shutdown of fuel supply;
- Fire doors, including their controls;
- General emergency alarm systems;
- Emergency escape breathing devices;
- Portable fire extinguishers, including spare charges;
- Fire fighter's-outfits;
- Inert gas systems;
- Deck foam systems;
- Fire safety arrangements in cargo pump rooms; and
- Flammable gas detectors. (SOLAS II-2/14.2.2.3 and 14.4)

5.61 Are records available to show that samples of foam compound have been tested at regular intervals?

The first periodical control of medium expansion foam concentrates stored on board should be performed after a period of 3 years and, after that, every year. (MSC/Circ.798/5.1)

A record of the age of the foam concentrates and of subsequent controls should be kept on board. (MSC/Circ.798/5.2)

5.62 Is a fire control plan exhibited within the accommodation, is a copy also available externally and is equipment correctly marked on it?

Note: The requirements for fire plans are contained in SOLAS II-2/15.2.4. IMO Resolution A.654(16) recommends the symbols to be used on fire control plans.

5.63 Are fire mains, pumps, hoses and nozzles in good order and available for immediate use?

Note: Consistent with safety and without interfering with operations, randomly select isolating valves for demonstration of correct operation.

5.64 Are isolating valves in fire and foam system lines clearly marked and in good order?

5.65 Is the International ship/shore connection readily available externally and is the location clearly marked?

The connection shall be of steel or other suitable material. The connection shall be kept aboard the ship together with a gasket of any material suitable, with four 16 mm bolts, 50 mm in length and eight washers. (SOLAS 1974 II-2/19, SOLAS 2004 II-2/10.2.1.7 and FSS Code 2)

5.66 Are fixed fire detection and alarm systems in good order and tested regularly?

Notes: There should be a procedure for whenever a zone of a fire detection system is isolated to ensure that relevant personnel are aware of the isolation and the reason for it and to ensure that the zone is reinstated as soon as possible.

The engine room should not be operated unmanned with any zone in the space isolated.

Spaces not covered by a fire detection system should be covered by regular fire patrols. Such patrols should not utilise the bridge lookout during the hours of darkness.

5.67 Are the main deck, pump room, engine room and other fixed fire extinguishing systems, where fitted, in good order and are clear operating instructions posted?

Paint lockers and flammable liquid lockers shall be protected by an appropriate fire-extinguishing arrangement approved by the administration. (SOLAS 1974 II-2/18.7 and SOLAS 2004 II-2/10.6.3.2)

For ships constructed after 1st July 2002, paint lockers shall be protected by:

- *A CO₂ system, designed to give a minimum volume of free gas equal to 40% of the gross volume of the protected space; or*
- *A dry powder system, designed for at least 0.5 kg powder/m³; or*
- *A water spraying system; or*
- *A system providing equivalent protection, as determined by the administration.*

(SOLAS 2004 II-2/10.6.3.1)

For lockers of a deck area of less than 4m² which do not give access to accommodation spaces, a portable CO₂ extinguisher sized to provide a minimum volume of free gas equal to 40% of the gross volume of the space may be accepted in lieu of a fixed system. A discharge port shall be arranged in the locker to allow the discharge of the extinguisher without having to enter the protected space. The portable fire extinguisher shall be stowed adjacent to the port. Alternatively a port or hose connection may be provided to facilitate the use of fire main water. (SOLAS 2004 II-2/10.6.3.3)

5.68 Is the emergency fire pump in full operational condition and are starting instructions clearly displayed?

For ships constructed on or after 1st February 1992, the emergency fire pump shall operate under all conditions of list, trim, pitch and roll likely to be encountered in service.

(SOLAS 1974 II-2/4.3.3.2.5 and FSS Code 12.2.2.1.3)

Any service fuel tank shall contain sufficient fuel to enable the pump to run on full load for at least 3 hours and sufficient reserves of fuel shall be available outside the main machinery space to enable the pump to be run on full load for an additional 15 hours. (SOLAS 1974 II-2/4.3.3.2.4 and FSS Code 12.2.2.2.2)

Every oil fuel pipe, which, if damaged, would allow oil to escape from a storage, settling or daily service tank situated above the double bottom, shall be fitted with a cock or valve directly on the tank capable of being closed from a safe position outside the space concerned in the event of a fire occurring in the space in which such tanks are situated. (SOLAS 74 II-2/15.2.5)

Oil fuel pipes, which if damaged would allow oil to escape from a storage, settling or daily service tank having a capacity of 500 litres and above situated above the double bottom, shall be fitted with a cock or valve directly on the tank capable of being closed from a safe position outside the space concerned in the event of a fire occurring in the space in which such the tanks are situated. (SOLAS 2004 II-2/4.2.2.3.4)

Notes: Consistent with safety and without interfering with the vessel's operations, request to witness the starting and operation of the emergency fire pump.

If a priming system has been fitted to the emergency fire pump, it must be class approved.

5.69 Are portable fire extinguishers in good order with operating instructions clearly marked?

Each extinguisher should be clearly marked with the following minimum information:

- *Name of the manufacturer;*
- *Type of fire for which the extinguisher is suitable;*
- *Type and quantity of extinguishing medium;*
- *Approval details;*
- *Instructions for use and recharge (it is recommended that operating instructions be given in pictorial form);*
- *Year of manufacture;*
- *Temperature range over which the extinguisher will operate satisfactorily; and*
- *Test pressure.* *(FSS Code 4 and Res. A.602)*

One of the portable fire extinguishers intended for use in any space shall be stowed near the entrance to that space. *(SOLAS 1974 II-2/6.6 and SOLAS 2004 II-2/10.3.2.2)*

For vessels constructed after 1st July 2002, spare charges shall be provided for 100% of the first ten extinguishers and 50% of the remaining fire extinguishers capable of being recharged on board. Not more than sixty total spare charges are required. Instructions for recharging shall be carried on board. For fire extinguishers which cannot be recharged on board, additional portable fire extinguishers of the same quantity, type, capacity and number shall be provided in lieu of spare charges.

(SOLAS 2004 II-2/10.3.3.1 and 2)

For vessels constructed before 1st July 2002, spare charges shall be provided in accordance with requirements specified by the administration. *(SOLAS 1974 II-2/6.2)*

5.70 Are firemen's outfits and breathing apparatus in good order and ready for immediate use?

Tankers shall carry four firemen's outfits, which shall consist of:

- *Protective clothing of material to protect the skin from the heat radiating from the fire and from burns and scalding by steam. The outer surface shall be water-resistant;*
- *Boots of rubber or other electrically non-conducting material;*
- *A rigid helmet providing effective protection against impact;*
- *An electric safety lamp of an approved type with a burning period of 3 hours. Safety lamps on tankers and those intended to be used in hazardous areas shall be of an explosion-proof type;*
- *An axe with a handle provided with high-voltage insulation;*
- *A breathing apparatus of an approved type; and*
- *For each breathing apparatus a fireproof line of at least 30 metres in length, capable of being attached by means of a snap-hook to the harness of the apparatus or to a separate belt in order to prevent the breathing apparatus becoming detached when the lifeline is operated.*

(SOLAS 1974 II-2/17, SOLAS 2004 II-2/10.10 and FSS Code 3/2.1.1)

A number of spare charges, suitable for use with the apparatus provided, shall be available on board to the satisfaction of the administration. *(SOLAS 74 II-2/17.1.2.2)*

Two spare charges shall be provided for each required breathing apparatus.....cargo ships that are equipped with suitably located means for fully recharging the air cylinders free from contamination need carry only one spare charge for each required apparatus. *(SOLAS 2004 II-2/10.2.5)*

Notes: For vessels constructed before 1st July 2002, the breathing apparatus may be either a smoke helmet type, or a self-contained compressed air type. A number of spare charges suitable for use with the apparatus provided shall be available on board to the satisfaction of the administration

(SOLAS 1974 II-2/17.1.2)

The outfits shall be kept ready for use in an easily accessible location that is permanently and clearly marked and, they shall be stored in widely separated positions.

(SOLAS 1974 II-2/17.4 and SOLAS 2004 II-2/10.3.1)

Notes: Although SOLAS recommends 'widely separated positions', fire-fighting training advocates that breathing apparatus should be used by personnel in pairs.

Self-contained breathing apparatus should be checked for condition and satisfactory operation. With the apparatus charged and the cylinder valve closed, the drop in pressure should not be more than 10 bars in one minute. *(Manufacturer's instructions)*

5.71 Are breathing apparatus sets fitted with fully pressurised air cylinders?

Note: Air cylinders should be charged to not less than 10% below full.

5.72 Are emergency escape breathing devices (EEBD's) in the accommodation, pump room and engine room in good order and ready for immediate use?

All ships shall carry at least two emergency escape breathing devices within accommodation spaces.

(SOLAS II-2/13.3.4.2)

On all ships, within the machinery spaces, emergency escape breathing devices shall be situated ready for use at easily visible places, which can be reached quickly and easily at any time in event of fire. The location of EEBD's shall take into account the layout of the machinery space and the number of persons normally working in the spaces. (SOLAS II-2/13.4.3.1)

Spare emergency escape breathing devices shall be kept on board. (SOLAS II-2/13.3.4.1)

Training in the use of the EEBD should be considered a part of basic safety training. (MSC/Circ.849)

Note: The requirements for EEBD's are contained in Chapter 3/2.23 of the FSS Code and MSC/Circ.849 and stipulate:

- *They shall have a service duration of at least 10 minutes;*
- *Brief instructions or diagrams clearly illustrating their use shall be clearly printed on the EEBD;*
- *An EEBD, when stored, shall be suitably protected from the environment;*
- *Maintenance requirements, serial number, date of manufacture and shelf life shall be printed on each EEBD;*
- *Training EEBD's shall be clearly marked.*

5.73 Are accommodation and ventilation fan emergency stops in good order and clearly marked to indicate the spaces they serve?

5.74 Are fire flaps in good order and clearly marked to indicate the spaces they serve?

Access:

5.75 Is a gangway provided?

Note: All vessels should be provided with a gangway.

5.76 Are accommodation ladders, gangways, pilot ladders and pilot hoists, where fitted, in good order?

5.77 Are all means of access satisfactory, including the provision of a safety net, lifebuoy and line?

Notes: Safety nets should be rigged wherever there is a possibility of a person falling over or through the side rails of the gangway and should be spread out at the ship's side to prevent anyone falling between the ship and quay. Where the rails provide adequate protection, a safety net might not be necessary.

It is the ship's responsibility to ensure that a safety net is rigged regardless as to who supplied the gangway. If the means of access are considered to be unsafe, then the inspector must not put him/herself at risk by going on board.

5.78 Are pilot boarding and access arrangements satisfactory?

In all ships where the distance from sea level to the point of access to, or egress from, the ship exceeds 9 metres and where it is intended to embark and disembark pilots by means of the accommodation ladder, or by means of mechanical pilot hoists or other equally safe and convenient means in conjunction with a pilot ladder, the ship shall carry such equipment on each side, unless the equipment is capable of being transferred for use on either side. (SOLAS V/23.3.2)

Where the distance from the surface of the water to the point of access to the ship is more than 9m, the accommodation ladder in conjunction with a pilot ladder shall be used. The accommodation ladder shall lead aft and the lower end shall rest firmly against the ship's side within the parallel body length of the ship and clear of all discharges. (SOLAS V/23.3.3.2)

Means shall be provided to ensure safe, convenient and unobstructed passage for any person embarking on, or disembarking from, the ship between the head of the pilot or accommodation ladder and the deck. (SOLAS V/23.4)

Adequate lighting shall be provided to illuminate the transfer arrangements overside and the position on deck where a person embarks or disembarks. (SOLAS V/23.8)

5.79 Are safe access to the bow arrangements satisfactory?

Every petroleum, chemical and gas tanker shall be provided with the means to enable the crew to gain safe access to the bow even in severe weather conditions. (SOLAS II-1/3-3)

Note: The requirements for safe access to the bow are contained in MSC.62(67).

5.80 If a helicopter landing or winching area is provided, is it Aviation Authority approved, or if not does it meet ICS guidelines?

The landing area should be a series of 3 concentric circles (although landing areas with extended zones at the ship's side are preferred), painted yellow:

- *The inner 'aiming circle', 0.5D, where there are no obstructions above 0.1 metre;*
 - *The middle 'clear zone', D, where there are no obstructions above 0.25 metres; and*
 - *The outer 'manoeuvring zone', 1.3D, where there are no obstructions above 1.25 metres;*
 - *A white 'H', 3.6 by 1.8 metres, should be painted in the centre and the diameters of the aiming and clear zones should also be marked in white at four equidistant points on their circles.*
- (Guide to helicopter/ship operations 4.2)*

Winching areas consist of two concentric zones:

- *The inner 'clear zone', a yellow circle at least 5 metres in diameter, which is clear of all obstructions; and*
- *The outer 'manoeuvring zone', which is 2D, marked with a broken yellow line and which ideally should be clear of obstructions above 3 metres, but obstructions not higher than 6 metres may be permitted between 1.5D and 2D. Obstructions in the manoeuvring zone should be painted in contrasting colours to other paintwork.*

Consideration should be given to marking the words 'winch only' in large white letters in the manoeuvring zone.
(Guide to helicopter/ship operations 4.2)

During helicopter operations the following fire fighting equipment should be provided: two dry powder extinguishers, a suitable foam application system, CO² extinguishers, a deck water system, two dual-purpose fire hose nozzles, a fire resistant blanket and gloves and sufficient fire proximity suits.

(Guide to helicopter/ship operations 4.8)

During helicopter operations the following additional equipment should be provided: a large axe, crowbar, wire cutters, red emergency signal/torch, marshalling batons (at night) and first aid equipment.

(Guide to helicopter/ship operations 6.1.1)

Notes: The landing areas should be as large as practicable with a clear zone diameter, D, which is greater than the overall length (with rotors turning) of the helicopter which uses it. (The smallest helicopter in marine use has an overall length of about 12 metres, the largest (single rotor) about 22 metres).

Detailed requirements for helicopter facilities for vessels constructed on or after 1st July 2002 are also contained in SOLAS 2004 II-2 Part G.

Additional comments:

If the Inspector has comments in respect of the subject matter covered by the Chapter additional to those which the Inspector may make in response to the specific key questions in the Chapter, the Inspector should include such additional comments in this section.

Chapter 6. Pollution prevention

Oil Record Books:

- 6.1 Are the Engine Room (Part I) and Cargo (Part II) Oil Record Books correctly completed?
- 6.2 Do the sludge and bilge tanks designated in Form B of the IOPP Certificate and those listed in the engine room oil record book, agree?
Notes: Details of bilge and sludge tanks can be obtained from Form B of the IOPP Certificate, although the recording of bilge tanks (section 3.3) is not a MARPOL requirement and is therefore voluntary. In Part 1, section C should be used for the disposal of sludge and other oil residues such as drainage, leakage, exhausted oil etc. and this section should be completed at the end of each voyage, or weekly if more than one voyage within the week. Sections D and/or E should be used for the disposal of bilge water as and when it occurs. It is recommended in MARPOL that receipts are obtained for all disposals to reception facilities and that these are attached to the oil record book.
- 6.3 Are the Oil Record Books free of any pollution incidents or violations?
- 6.4 Have disposals of slops and dirty ballast been adequately recorded and were they in accordance with MARPOL?
- 6.5 If the disposal of engine room oily water or sludge to a cargo or slop tank has taken place, has the event been recorded in both Oil Record Books, was the receiving tank free of cargo and have the transfer arrangements been approved by class?

Shipboard oil and marine pollution emergency plans:

- 6.6 Is an approved MARPOL Shipboard Oil Pollution Emergency Plan (SOPEP) or Shipboard Marine Pollution Emergency Plan (SMPEP) provided?
Every oil tanker of 150 gt and above and every ship other than an oil tanker of 400 gt and above shall carry on board a shipboard oil pollution emergency plan approved by the administration. (MARPOL Annex I/26)
- The plan shall be written in the working language of the master and officers and shall at least consist of:*
- *The procedure to be followed by the master or other persons having charge of the ship to report an oil pollution incident;*
 - *The list of authorities or persons to be contacted in the event of an oil pollution incident;*
 - *A detailed description of the action to be taken immediately by persons on board to reduce or control the discharge of oil following the incident; and*
 - *The procedures and point of contact on the ship for co-ordinating shipboard action with national and local authorities in combating the pollution. (MARPOL Annex I/25.2)*
- Every ship of 150 gt and above certified to carry noxious liquid substances in bulk shall carry on board a shipboard marine pollution emergency plan for noxious liquid substances approved by the administration. (MARPOL Annex II/16.1)*
- The plan shall be written in a working language or languages understood by the master and officers and shall at least consist of:*
- *The procedure to be followed by the master or other persons having charge of the ship to report a noxious liquid substances pollution incident;*
 - *The list of authorities or persons to be contacted in the event of a noxious liquid substance pollution incident;*
 - *A detailed description of the action to be taken immediately by persons on board to reduce or control the discharge of noxious liquid substances following the incident; and*
 - *The procedures and point of contact on the ship for co-ordinating shipboard action with national and local authorities in combating the pollution. (MARPOL Annex II/16.2)*
- In the case of ships to which regulation 16 of Annex II (regulation 25 of Annex I) also applies, such a plan may be combined with the shipboard marine pollution emergency plan for noxious liquid substances required under regulation 16 of Annex II (regulation 25 of Annex I). In this case, the title of such a plan shall be 'Shipboard Marine Pollution Emergency Plan'. (MARPOL Annex I/25.3 and II/16.3)*

Note: The plan is subject to re-approval after a change of management.

6.7 Does the plan include a description of equipment, its location, a plan for deployment and specific crewmember duties for handling small spills?

6.8 Is the IMO Coastal Contact List up to date, is the master aware of port contact procedures and has a contact list been made for this port?

Notes: The IMO Coastal Contact List is published on 31st December and updated on 31st March, 30th June and 30th September each year. This information is published on the IMO web site at www.imo.org.

A list of specific contact numbers should be prepared for the port and be readily available to the master and displayed in the cargo control room. The list should at least include the contact numbers for the DPA (or the operator's emergency contact details), the port authorities, the P and I Club, the agent and the national pollution reporting centre from the Coastal Contact List.

6.9 Is there a USCG approved Vessel Response Plan (VRP)?

Note: A VRP must be provided for oil and chemical tankers trading to the USA. SOPEP's, SMPEP's and VRP's can be either in a single combined plan or in separate documents.

6.10 Name of the OPA-90 Qualified Individual (QI):

Note: The name of the OPA-90 qualified individual must be recorded in the VRP.

Cargo operations and deck area pollution prevention:

6.11 Are officers aware of the requirements of MARPOL with respect to the disposal of bilge water and cargo slops?

6.12 Is the condition of scupper plugs satisfactory and are scuppers effectively plugged?

Note: Scuppers on gas carriers will only be required to be plugged when bunkering or if carrying a MARPOL Annex 1 cargo.

6.13 Is the ship fitted with a maindeck boundary coaming?

Notes: The purpose of this coaming is to provide oil retention at the after end of the maindeck in the event of an oil spill, giving the crew sufficient time to deal with it and avoid oil entering the water. The effectiveness of the height of the boundary coaming can only be decided when it is related to the volume that can be retained with respect to the trim and the camber of the deck.

This question does not apply to vessels which only carry LPG or LNG cargoes.

6.14 Are means readily available for dealing with small oil spills?

Notes: Means should be provided for the prompt removal of any spillage on deck. Spill equipment should be readily available at the manifold and there should be an adequate method (spill pumps or dumping arrangements to a cargo tank or other equally effective means) for the rapid disposal of oil at the aft end of the main deck on both sides of the vessel.

If the use of a cargo tank or slop tank is not a viable option, an alternative enclosed container with a capacity of at least 2 m³ should be available for the disposal of spills and oily water from the deck.

Portable spill pumps should be bonded to the vessel's structure to prevent electrical discharge to earth. Bonding may be made by external means, or by the discharge hose, if this is attached by means of a flanged connection to the vessel's structure. Pumps should also be mounted to prevent movement and subsequent damage during operation.

Where portable spill pumps are provided and the discharge is led to a cargo tank, there should be a suitable fixed connection. Disposal of a spill should not require the insertion of the spill pump discharge hose through a tank opening such as a sighting port.

Where dump valves are installed at the after end of the maindeck, ascertain whether opening the valves will actually result in the disposal of spilled oil to the tank. Excessive cargo tank vapour pressure can result in a release of pressure when the dump valve is opened, thereby aggravating the situation. U bends fitted in the dumping line to the tank may allow spills to be safely disposed of without first having to depressurise the tank, but this depends on the liquid level in the U-bend being adequate to prevent back-flow of vapour. The ullage of the cargo in the tank may also affect the ability to drain spills from the deck, particularly when the tank is full and the vessel is trimmed by the stern.

If effective draining of a spill cannot be achieved or if pressure release is required, an alternative method of immediately disposing of a spill should be provided.

It should be recognised that if the vessel is sagged a spill will accumulate amidships and if trimmed by the head then it will accumulate forward. Spill equipment and disposal facilities will have to be arranged to deal with these conditions.

- 6.15 Is the vessel free from any visible bulkhead, valve or pipeline leakage liable to cause pollution?**
- 6.16 Are cargo system sea and overboard valves suitably lashed, locked or blanked and are they thoroughly checked to ensure that they are fully closed prior to commencement of cargo transfer?**
Note: Records of such checks should be recorded in the Deck or Cargo Log Book. Anti-pollution warning notices should be posted in the vicinity of these valves.
- 6.17 If cargo sea suction valves are fitted, are adequate pollution prevention measures in place?**
Note: Two valves should be fitted at cargo sea suctions, unless the sea suctions are blanked or a spool piece to the cargo system has been removed.
- 6.18 If cargo sea suction valves are fitted, are valve-testing arrangements provided, are they in good order and regularly monitored for leakage?**
It is recommended that a device be installed to monitor pressure build-up and determine liquid make-up in the section of the pipeline which lies between the inboard and outboard sea valves. Such a device would both provide an early indication of leakage through either valve during cargo handling operations and enable the leaking valve to be identified. During cargo operations pressure build-up in this line would be apparent from the gauge reading and would indicate that one of the valves was leaking.
(OCIMF Cargo Pump Room Sea Valves 4)
Devices should be positioned so that both readings and samples can be taken from a point far enough above the pump room lower platform level that there is no possibility of human exposure to gas concentrations which may accumulate below the floor plates. (OCIMF Cargo Pump Room Sea Valves 4)
The use of a pressure/vacuum gauge, rather than a pressure-only gauge, is preferable in that it will provide a reliable indication of a vacuum in the line prior to opening the sea valve for ballasting.
(OCIMF Cargo Pump Room Sea Valves 4)
Note: Care should be taken that test pressures do not exceed 3.5.kg/cm².
- 6.19 If ballast lines pass through cargo tanks are they tested regularly and the results recorded?**
- 6.20 Are oil spill containers and gratings in place under the cargo manifolds and are they in good order?**
A permanently fitted spill tank, provided with suitable means of draining, should be fitted under all ship and shore manifold connections. Should no permanent means be provided, portable drip trays should be placed under each connection to retain any leakage.
- 6.21 Are manifold spill containers empty and are the drainage arrangements satisfactory?**
Note: Suitable means of draining the spill container to a cargo tank or spill tank should be provided.
- 6.22 Are unused cargo and bunker pipeline manifolds fully bolted and are all drains and vents and unused gauge stems, suitably blanked or capped?**
Notes: This includes all pipelines and fittings which are in use or which might become pressurised during cargo operations, on both sides of the vessel.
Blanks should be fully bolted. Drains and vents should be fitted with valves and either capped or plugged. Pressure gauge stems should be fitted with valves and capped whenever gauges are not fitted.
Guidance on manifold blanks is given in Chapter 8.
- 6.23 Are suitable spill containers fitted around all fuel, diesel and lubricating oil tank vents?**
Notes: The height of any savealls around bunker tank vents should not be greater than the vent heads themselves, because this could lead to the ingress of water in bad weather if the savealls become filled with water.
Containers should be empty of water and free of oil.

57

Drain plugs should be in place in port.

6.24 Is a suitable containment fitted around hydraulic and other deck machinery?

6.25 Are the arrangements for the disposal of oily water in the fore's'le and other internal spaces adequate?

Note: Where there is a possibility of hydraulic, fuel or other oil accumulating in internal space bilge wells, adequate arrangements should be in place for its disposal. Where hand pumps or ejectors are fitted, pollution prevention notices should be posted and the overboard valves should be secured against accidental opening.

Pump rooms and oil discharge monitors:

6.26 Are pump room bilge high level alarms fitted, regularly tested and the results recorded?

All pump rooms on all tankers constructed on or after 1st July 2002 shall be provided with bilge level monitoring devices together with appropriately located alarms. (SOLAS II-2/4.5.10.1.4)

For vessels constructed before 1st July 2002, the alarms shall be fitted by the date of the first scheduled docking after 1st July 2002, but not later than 1st July 2005. (SOLAS II-2/1.6.7)

Note: The pump room bilge high level alarm must be sited at a low point in the pump room bilge in order to be effective.

6.27 Are adequate arrangements for the emergency disposal of pump room bilge accumulations provided?

Notes: The draining of lines and pumps into the pump room bilges is an unsafe practice and every effort should be made to prevent volatile product being drained to the bilge. A stripping system to enable lines and pumps to be drained to a cargo or slop tank should be provided.

There should be an effective means to line up and operate the bilge system by remote operation from the pump room top, including where necessary a procedure for the pre-setting of valves to ensure that the system can be operated and bilges pumped during the voyage.

6.28 If an oil discharge monitoring system is fitted, is it in good order and is there evidence of recent testing?

6.29 If the ODME has not been operational, was the fact recorded in the Oil Record Book?

If the ODME is not currently operational, record with the observation how long it has been out of order and what remedial action is intended.

Note: The time of, and reason for, the failure and the time when the system was made operational again should have been recorded in the Oil Record Book.

Ballast water management:

6.30 Does the operator have a ballast water and sediments management plan and are records being maintained of all ballast water exchanges?

Notes: The International Convention for the Control and Management of Ships' Ballast Water and Sediments is a new international convention to help prevent the spread of harmful aquatic organisms carried by ships' ballast water, and will require all ships to implement a ballast water and sediments management plan. Some countries are introducing specific requirements for ballast water management and reporting, within their national limits, prior to the Convention coming into force.

The IMO has published 'Guidelines for the Control and Management of Ships Ballast Water to Minimise the Transfer of Harmful Aquatic Organisms and Pathogens' - (IMO Resolution A.868 (20)).

6.31 Can the vessel check or sample segregated ballast prior to deballasting?

Notes: A sample of the ballast tanks should be visually checked for oil contamination on each occasion before being discharged.

It is not satisfactory if numerous bolts must be removed from manhole covers to check that ballast is free of oil.

If this is the only means of checking, an observation must be made.

6.32 Are segregated ballast tanks free from evidence of oil?

Note: Additional to the requirements of Chapter 7 to check ballast tanks for structural and coating condition, the tanks should also be checked for oil contamination. Under no circumstances should an oil sheen be detected on the surface of ballast water.

Engine and steering compartments:

6.33 Are the engine room bilge oily water pumping and disposal arrangements in good order?

A direct connection overboard from a bilge pump used for the regular disposal of accumulations of bilge water, or for any other oil service, must be recorded as an observation.

Notes: SOLAS II-1 Reg. 21.3 requires tankers to have two pumps connected to the bilge pumping system, one of which may be driven by the propulsion machinery.

Any system used to transfer bilge or oily water mixtures for retention on board or discharge to deck, must be provided with positive means to ensure that oil or oily mixtures are not discharged into the sea.

Ascertain that a direct overboard discharge is not being used for the disposal of daily machinery space bilge accumulations.

The ship's side valve and associated overboard pipework should be checked for evidence of oil contamination.

6.34 Are emergency bilge pumping arrangements ready for immediate use; is the emergency bilge suction clearly identified and, where fitted, is the emergency overboard discharge valve provided with a notice warning against accidental opening?

Notes: SOLAS states that sanitary, ballast and general service pumps may be accepted as independent power bilge pumps where fitted with the necessary connections to the bilge pumping system. Although not specifically described as such, this SOLAS requirement is to permit bilges to be discharged overboard in an emergency situation and MARPOL Annex I Reg. 11 allows for this.

The emergency bilge overboard discharge must not be used for the disposal of daily machinery space bilge accumulations. Inspection of the ship's side valve and associated overboard pipework should be checked for evidence of oil contamination.

In addition to the SOLAS requirement for two means of disposing of bilges, there is a class requirement for an additional emergency bilge disposal system and this will utilise a sea water pump and will discharge directly overboard. This emergency bilge suction valve should be readily accessible and clearly marked as to its purpose.

These emergency systems must not be used for disposal of the daily bilge accumulations referred to in this question.

The means by which operation of the emergency overboard valve is controlled to prevent unauthorised discharge of oil or oily mixtures should be determined. Positive evidence that the overboard discharge valve has not been opened can be provided by use of a numbered seal, the number of which can be verified in official documents such as the Engine Room Log or the Oil Record Book. Such a method of sealing must be easily breakable to allow the valve to be opened in an emergency.

If the vessel has an ejector as a substitute for one of the bilge pumps then it may be necessary to ensure that the suction valves are similarly sealed.

6.35 Are dedicated sludge pumps free from any connection to a direct overboard discharge?

Piping to and from sludge tanks shall have no direct connection overboard, other than the standard discharge connection referred to in Regulation 19. (MARPOL 17 (3))

6.36 Is the oily water separator in good order?

In vessels over 400 tons gross tonnage there should be filtering equipment to ensure that the output is less than 15 ppm. (MARPOL 16)

Notes: The oily water separator will normally be supplied with its own supply pump (which may either pump or draw water through the separating unit).

Confirm that the oily water separator piping has not been altered, physically by-passed or has been fitted with connections to by-pass the unit and it should be verified that the sensing equipment has not been interfered with.

Inspectors should request a demonstration of how the oil content alarm is tested to prove satisfactory operation and familiarity of the crew with the equipment.

6.37 Are specific warning notices posted to safeguard against the accidental opening of the overboard discharge valve from the oily water separator?

Note: The overboard valve should be sealed and provided with a warning notice indicating that the valve should not be opened without the authority of the chief engineer or master.

6.38 Has the engine room oily water separator been fitted with an automatic stopping device?

Notes: Section 2.2 of Form B of the IOPP Certificate will indicate whether or not the engine room oily water separator has been fitted with an approved automatic stopping device.

In vessels over 10,000 tons gross tonnage the oily water separator should be fitted with an alarm and an automatic device that will stop the discharge of any mixture above 15 ppm.

If the oily water separator has not been fitted with an automatic stopping device, then the inspector must ascertain that it has not been used within a Special Area.

6.39 Are the arrangements for the disposal of steering compartment oily bilge water adequate?

Note: Where hydraulic, fuel or other oil may accumulate in steering compartment bilge wells, adequate arrangements should be in place for the disposal of it. Where hand pumps or ejectors are fitted, there should be pollution prevention notices posted and the overboard valves should be secured against accidental opening.

Garbage management:

6.40 Does the vessel have a garbage management plan and has garbage been handled and disposed of in accordance with MARPOL?

Every ship shall display placards which notify the crew of the disposal requirements of garbage.

(MARPOL Annex V/9.1.a)

For vessels engaged on international voyages the placards shall be in either English, French or Spanish.

(MARPOL Annex V/9.1.b)

When garbage is mixed with other discharges having different disposal or discharge requirements the more stringent requirements shall apply.

(MARPOL Annex V/5.3)

Garbage incineration is prohibited in the Baltic Sea.

(Helsinki Agreement 1990)

Waste receptacles should be constructed of non-combustible materials with no openings in the sides or bottom.

(SOLAS 1974 II-2/18.5 and SOLAS 2004 II-2/4.4.2)

The disposal into the sea of all plastics and incinerator ashes from plastic products which may contain toxic or heavy metal residues is prohibited.

(MARPOL Annex V/3.1)

Notes: Garbage containers should be covered, leak-proof and inside the railing.

If food waste is being disposed overboard, there must be strict separation in the galley.

The burning of plastic containing vinyl, PVC or PCB below a temperature of 800°C may produce toxic emissions.

6.41 Has the Garbage Record Book been correctly completed?

Additional comments:

If the Inspector has comments in respect of the subject matter covered by the Chapter additional to those which the Inspector may make in response to the specific key questions in the Chapter, the Inspector should include such additional comments in this section.

Chapter 7. Structural condition

Note: Tank entry should only be undertaken if a suitable safe opportunity exists and if it is permitted by the inspecting OCIMF member, the tanker operator and the terminal.

7.1 Is the hull free from visible structural defects that warrant further investigation?

Notes: Inspection of the hull should include checking for any evidence of structural problems including collision contact or distortion from heavy weather.

Class records should be examined to confirm that class has been involved whenever significant damage has occurred or been repaired.

7.2 Are weather decks free from visible structural defects that warrant further investigation?

Note: Inspection of weather decks should include checking for any evidence of wastage, structural problems including evidence of over-pressurisation, collision contact or distortion from heavy weather.

7.3 Is the superstructure free from visible structural defects that warrant further investigation?

7.4 Are internal spaces free from visible structural defects that warrant further investigation?

7.5 If any cargo and/or ballast tanks were inspected or sighted from the deck, were they in a satisfactory condition?

If the internals of a tank, or tanks, were sighted from the deck, record this fact in the comments and list the findings as appropriate.

Regardless of whether tank entry is made, the opportunity should be taken where possible to sight from the deck the internal condition of at least two compartments and the forepeak. Valuable indications as to the condition of compartments such as ballast tanks, access trunks and peak tanks can be made from a visual inspection from the outside.

Indications of unsatisfactory conditions can be wastage of handrails and ladder rungs, visible corrosion on vertical and horizontal framing, knife-edges on brackets, visible cracking and deformations of bulkheads or frames.

Leakage from adjacent tanks or valve glands may be indicated by an oil sheen on the ballast, the presence of gas or the sound of falling liquid.

7.6 If any cargo and/or ballast tanks were inspected internally, were they in a satisfactory condition?

If any cargo or ballast tanks were inspected internally, record the following information:

- The names of the compartment(s) inspected;
- Where fitted, details of the condition of anodes;
- Details of any fractures noted in any part of the structure;
- Details of any visible corrosion wastage;
- Details of localised pitting, particularly in bottom plating and under bell mouths;
Note: Use the pitting diagrams contained in the appendix.
- Details of any visible signs of buckling;
- If applicable, the condition of the coating (good, fair or poor);
Note: Use the coating breakdown diagrams contained in the appendix.
- Details of any signs of hard rust;
- Areas of concern with respect to pipelines, bulkhead penetrations, ladders, fittings etc.;
- Evidence of leakage from adjacent compartments.

For the purposes of this report, coating condition 'good', 'fair' or 'poor' is defined as follows:

- **Good** condition with only minor spot rusting;
- **Fair** condition with local breakdown at edges of stiffeners and weld connections and/or light rusting over 20% or more of areas under consideration, but less than as defined for -poor condition;
- **Poor** condition with general breakdown of coating over 20% or more of areas or hard scale at 10% or more of areas under consideration.

Additional comments:

If the Inspector has comments in respect of the subject matter covered by the Chapter additional to those which the Inspector may make in response to the specific key questions in the Chapter, the Inspector should include such additional comments in this section.

Chapter 8 Cargo and ballast systems - petroleum

Note: 'ISGOTT' contains guidance pertaining to the safe carriage and handling of petroleum products. Inspectors should observe cargo operations, interview responsible personnel, review the operator's operating procedures and observe the degree of compliance by officers and crew to appropriate regulations and guidelines. Common causes of incidents are poor planning, improper supervision of transfer operations, inadequate knowledge or disregard of the dangers of static electricity, insufficient personnel on duty and insufficient or incorrect information concerning cargo properties.

Policies, procedures and documentation:

- 8.1 Is the vessel provided with operator's policy statements, guidance and procedures with regard to safe cargo operations?
- 8.2 Is information readily available on maximum loading rates and venting capacities?
Note: This information should be displayed in the cargo control area.
- 8.3 Are legible and up to date pipeline and/or mimic diagrams of cargo, inert gas and venting systems, as applicable, available in the cargo control area?
- 8.4 Are cargo pump performance curves available, where applicable, for various speeds?
- 8.5 Is a written procedure provided for the safe handling of heavy weather ballast in cargo tanks on segregated ballast tankers?

Stability and cargo loading limitations:

- 8.6 If a loading computer or programme is in use, is it class approved?
If a class approved loading computer is not available, record how stress and stability calculations are performed.
Notes: Class requirements are that ships of more than 65 metres in length shall be provided with an approved type loading instrument. Ships with very limited possibilities for variations in the distribution of cargo and ballast and ships with a regular or fixed trading pattern may be exempt from the requirement. The loading instrument should be capable of calculating shear forces and bending moments in any load or ballast condition at specified readout points and should indicate the permissible values.
- 8.7 Do records indicate that the loading computer is tested regularly for operational accuracy?
Note: Class approved data should be used and the tests should be carried out at least quarterly.
- 8.8 Is the stress and stability information included with the cargo plan; have stability and where applicable, stress calculations been performed for the current cargo operation and do the cargo watch officers understand any limitations?
Notes: Inspectors should determine that prior to transfer of cargo, calculations have been made for stress and stability conditions for the start, interim and completion of transfer conditions. Regular monitoring of stress and stability should be taking place throughout cargo transfer to ensure that the conditions have been maintained within design limits
- 8.9 Is the vessel free of inherent intact stability problems?
Notes: Vessels that have large width tanks will be subject to reductions of intact stability due to free surface. Although such vessels may meet IMO intact stability criteria when in fully loaded or ballasted conditions, they may be unstable when multiple tanks are slack during cargo or ballast transfer operations, or in intermediate states of loading. Trim and stability manuals generally deal only with arrival and departure conditions and operators are not made aware that stability problems may exist at intermediate stages during cargo transfers. If a vessel has either large width cargo tanks, U section ballast tanks, or double bottom tanks without watertight centreline bulkheads, inspectors should ascertain that the vessel meets IMO intact stability criteria by requesting the chief officer to demonstrate, using the class approved loading instrument, the intact stability at the worst case condition (all tanks slack and maximum free surface).

If no suitable loading instrument is provided and adequate instructions are not available, the question should be answered 'No', unless there is satisfactory proof that the vessel is free of inherent stability problems.

Specific procedures that have been adopted to address potential stability problems should be recorded.

- 8.10 Do the operator's operating manuals include procedures for restoring stability in case of unstable conditions developing during cargo operations, where applicable?
- 8.11 Where applicable, are officers aware of the dangers of free surface effects and of the possibility of structural damage caused by sloshing in cargo tanks?
- 8.12 Are cargo and/or ballast tanks free of sloshing or other restrictions?
Important restrictions other than maximum permitted cargo density should be recorded.

Cargo operations and related safety management:

- 8.13 Are all officers familiar with the cargo system?
- 8.14 Are all officers familiar with the carriage requirements for the cargoes on board?
Note: Officers should be able to demonstrate a basic knowledge of the following:
- *Shipboard operations and cargo handling;*
 - *Closed loading, discharging and sampling;*
 - *Requirements for medical treatment following exposure to hazardous cargoes;*
 - *Spill response;*
 - *Communication procedures with shore and emergency stop procedures;*
- And, as required:*
- *Effects of high density cargoes;*
 - *Hazards associated with toxic cargoes;*
 - *Hazards of electrostatic generation.*
- 8.15 Has a cargo plan been prepared and does it contain a detailed sequence of cargo and ballast transfer?
Note: The plan should cover all stages of the transfer operations and as a minimum, contain:
- *Quantity and grade of each parcel;*
 - *Density, temperature and other relevant properties;*
 - *A plan of the distribution, lines and pumps to be used;*
 - *Transfer rates and maximum allowable pressures;*
 - *Critical stages of the operation;*
 - *Notice of rate change;*
 - *Venting requirements;*
 - *Stability and stress information;*
 - *Drafts and trims;*
 - *Ballast operations;*
 - *Emergency stop procedures;*
 - *Emergency spill procedures and spill containment; and*
 - *Hazards of the particular cargoes.*
- And also, as required:*
- *Precautions against static generation;*
 - *Initial start-up rates;*
 - *Control of cargo heating systems;*
 - *Line clearing;*
 - *Crude oil washing procedures;*
 - *Under keel clearance limitations;*
 - *Bunkering; and*
 - *Special precautions required for the particular operation.*
- 8.16 Has the cargo plan been signed by the watch officers to indicate their understanding of it?
- 8.17 Are cargo operations being carried out and logged in accordance with the plan?

- 8.18 Are Material Safety Data Sheets (MSDS) on board for all the products being handled and are all officers familiar with their use?

Note: An MSDS should be posted for each grade of cargo carried, including crude oils. Material Safety Data Sheets should be parcel-specific. If the MSDS does relate to the particular cargo parcel being carried, the officers should be aware of its limitations.

- 8.19 Are all officers aware of the emergency procedures for dealing with leakage, spillage or fire involving the cargo?
- 8.20 Is the verbal communication between the ship and the shore adequate?

Cargo and ballast handling and monitoring equipment:

- 8.21 Are the following, where fitted, in good order and is there recorded evidence of regular testing?

Cargo, ballast and stripping pumps, eductors and their associated instrumentation and controls;	
Cargo and ballast pump bearing, casing and shaft gland temperature monitoring;	<p><i>On vessels constructed on or after 1st July 2002, cargo pumps, ballast pumps and stripping pumps, installed in cargo pump rooms and driven by shafts passing through pump room bulkheads shall be fitted with temperature sensing devices for bulkhead shaft glands, bearings and pump casings. A continuous audible and visual alarm signal shall be automatically effected in the cargo control room or the pump control station.</i></p> <p><i>(SOLAS 2004 II-2/4.5.10.1.1)</i></p> <p><i>All other tankers shall be fitted with the above temperature sensing devices by the date of the first scheduled docking after 1st July 2002 but not later than 1st July 2005. (SOLAS 2004 II-2/1.6.7)</i></p> <p><i>Notes: The requirement is to provide an alarm. There is no requirement for temperatures to be displayed, or for a high temperature trip to operate.</i></p> <p><i>Cargo pump bearings should not be fitted with temporary cooling arrangements.</i></p>
Cargo, crude oil washing, vapour and inert gas lines;	<p><i>Note: This includes corrosion of bolts and flanges on dresser couplings.</i></p>
Cargo pump emergency shut down system;	<p><i>Pump alarms and trips, level alarms, etc., where fitted, should be tested regularly to ensure that they are functioning correctly, and the results of these tests should be recorded.</i></p>
Cargo and ballast system valves;	
Cargo system ullage gauges, vapour locks and UTI tapes;	
Remote and local temperature and pressure sensors and gauges;	
Cargo tank high level alarms.	<p><i>Record if high level alarms are not fitted and also if the overfill alarm system is not independent of the main gauging system.</i></p> <p><i>Note: High level alarms should be in operation during both loading and discharging operations.</i></p>

- 8.22 Are cargo pipelines tested annually?
- Note: Cargo pipelines should be tested to 1.25 times their designed working pressure at least annually and be marked with the date of test and the pressure.*
- 8.23 Where fitted and in use, is the condition of the cargo tank heating system satisfactory, is it regularly tested and is any observation tank free of oil?

Notes: Where steam cargo heating systems are fitted and when a heated cargo is being carried at the time of the inspection, an indication of the condition of the heating coils can be provided by inspection of the hot well or observation tank.

A very small amount of oil (a few drops) on the surface of hot wells or observation tanks can be considered normal, but a layer of oil over the surface indicates that there is a problem of some significance.

In the case of thermal heating systems, piping should be sound, pumps, joints and glands should be free of leaks and the heater unit should be in satisfactory condition. Where parts can be isolated, procedures should be in place to identify and record which part is isolated.

Ullaging, sampling and closed operations:

- 8.24 Are vapour locks, where fitted, calibrated and certified by a recognised cargo inspection organisation?**

Note: Corrections for datum levels and for list and trim should be checked and approved by the organisation certifying the system if ullages from retrofitted vapour locks are used for cargo calculation.

- 8.25 If fixed tank gauges are not fitted, are sufficient portable tapes provided to simultaneously gauge each tank being worked?**

If a fixed cargo tank gauging system is fitted but unreliable and portable tapes/vapour locks are being used as the main method of ullaging, this fact should be recorded.

Note: Portable tapes should be calibrated in accordance with manufacturer's recommendations and valid certificates of calibration should be provided for each instrument.

- 8.26 If the vessel is handling volatile or toxic cargoes, is it operating in a closed condition?**

All tankers fitted with a fixed inert gas system shall be provided with a closed ullage system.

(SOLAS II-2/4.5.5.3.3)

Notes: A volatile product is petroleum having a flash point below 60°C as determined by the closed cup method of testing.

If a cargo is being handled at a temperature within 10°C of its flashpoint, it should be considered volatile. Therefore a cargo with a flashpoint of 80°C should be considered volatile if handled at a temperature of 70°C or above.

- 8.27 Do tank hatches, tank cleaning apertures and sighting ports appear to be liquid and gas tight?**

Venting arrangements:

- 8.28 Is the cargo venting system in a satisfactory condition?**

Note: The condition of p/v valves, mast risers, vent stacks, vapour lines, vacuum valves and flame screens should be assessed.

- 8.29 Is the cargo venting system being operated correctly?**

- 8.30 Are SOLAS secondary venting requirements being complied with?**

A secondary means of full flow relief of vapour, air or inert gas mixtures shall be provided to prevent over-pressure or under-pressure in the event of failure of the primary venting arrangements.

Alternatively, pressure sensors may be fitted in each tank protected by the primary venting arrangement with a monitoring system in the cargo control room or the position from which cargo operations are normally carried out. Such monitoring equipment shall also provide an alarm facility which is activated by detection of over-pressure or under-pressure conditions within a tank. (SOLAS 2000 II-2/11.6.3.2)

Note: Class societies may accept a system that may not comply with the SOLAS requirements for 'Secondary means of full flow relief'.

In such cases the question should be answered 'No'. A full description of the system as fitted should be made as an observation to allow an assessment of acceptability to be made.

- 8.31 If stop valves are fitted which permit isolation of individual tanks from the common venting system, are they provided with positive locking arrangements and are the keys under the control of a responsible officer?**

Where the arrangements are combined with other cargo tanks, either stop valves or other acceptable means shall be provided to isolate each cargo tank. Where stop valves are fitted, they shall be provided with locking arrangements which shall be under the control of the responsible ship's officer. There shall be a clear visual indication of the operational status of the valves or other acceptable means.

(SOLAS II-2/4.5.3.2.2)

8.32 Are the P/V valves in good order, inspected and cleaned as part of a regular maintenance routine and are there records to support this?

Notes: High jet cones and flaps should not be jacked open, particularly when loading.

Verify that p/v valves, where fitted, are tight and in a satisfactory condition and that the venting system is designed and operated in accordance with SOLAS.

High velocity vents are not fitted with flame screens and their correct operation relies on a pressure build-up within the compartment, which opens the valve at a predetermined level and which then results in a gas exit velocity of a minimum of 30 metres/sec. This provides protection against the passage of flame, the speed of which is about 7.5 metres/sec.

Consistent with safety and without interfering with operation and if appropriate to the design of the venting equipment, request the manual lifting of p/v valves to demonstrate satisfactory operation.

P/V valves should be checked for free movement prior to the commencement of each cargo operation as required by the Ship to Shore Safety Check List - Question 18.

8.33 Are flame screens easily accessible and removable, in good order and inspected and cleaned as part of a regular maintenance routine and are there records available?

Note: The vacuum valve of a p/v valve will be fitted with a flamescreen.

Inert gas system:

8.34 Is the vessel fitted with an inert gas system?

For tankers of 20,000 tonnes deadweight and upwards, the protection of the cargo tanks shall be achieved by a fixed inert gas system. (FSS Code 15.2.3.1.4.3)

8.35 Was the inert gas system in use at the time of the inspection?

8.36 Is a log kept of inert gas operations?

8.37 Are records maintained of equipment maintenance, including the overhaul of the non-return valve?

A non-return valve or equivalent shall be fitted forward of the deck water seal, provided with positive means of closure. As an alternative to positive means of closure, an additional valve having such means of closure may be provided forward of the non-return valve to isolate the deck water seal from the inert gas main. (SOLAS II-2/62.10.8)

8.38 Is an operator's policy provided that complies with IMO guidelines in case of failure of the inert gas system and do the master, chief officer and the officers standing cargo watches understand this?

Note: In the event that the inert gas system is unable to meet operational requirements of this regulation and it has been assessed that it is impracticable to effect a repair, then cargo discharge, deballasting and necessary tank cleaning shall only be resumed when the emergency conditions laid down in the 'IMO Guidelines on Inert Gas Systems' are complied with.

In brief, these guidelines state that:

1) In the case of tankers engaged in the carriage of crude oil, it is essential that the tanks be maintained in the inerted condition to avoid the danger of pyrophoric iron sulphide ignition. If it is assessed that the tanks cannot be maintained in an inerted condition before the inert gas system can be repaired, an external supply of inert gas should be connected to the system to avoid air being drawn into the cargo tanks.

(IMO Inert Gas Systems 8.2)

2) In the case of the carriage of products, if it is considered totally impracticable to effect repair of the inert gas system, cargo discharge may only be resumed if an external supply of inert gas is connected, or the following precautions are taken:

- That approved devices, or flame screens, to prevent the passage of flame into cargo tanks are fitted and checked to ensure that they are in good order;*
- The valves on the mast risers are opened;*

- *No free fall of water or slops is permitted; and*
 - *No dipping, ullaging, sampling or other equipment should be introduced into the tank until a period of five hours since injection of inert gas ceased. If essential for the safety of the operation, this should be done only after 30 minutes have elapsed and all metal components should be securely earthed.* (IMO Inert Gas Systems 8.3)
- 8.39 Is the inert gas system including instrumentation, alarms, trips and pressure and oxygen recorders, in good order?
- 8.40 Is the oxygen content of the inert gas delivery at or below the permitted maximum?
Record if the oxygen delivery is more than 5% or if a high oxygen level alarm is not fitted, regardless of the date of delivery.
- For tankers constructed after 1st September 1984:*
The system shall be capable of maintaining the atmosphere in any part of any cargo tank with an oxygen content not exceeding 8% by volume and at a positive pressure at all times in port and at sea, except when it is necessary for the tank to be gas free. (FSS Code 15.2.1.3.2)
The system shall be capable of delivering inert gas with an oxygen content of not more than 5% by volume in the inert gas supply main to the cargo tanks. (FSS Code 15.2.2.1.3)
- For tankers constructed before 1st September 1984:*
Tankers constructed before 1st September 1984 which are required to have an inert gas system shall at least comply with the requirements of regulation II-2/62 of SOLAS 1974. (SOLAS 2001 II-2/62.20)
This states: The inert gas system shall be capable of providing on demand a gas or mixture of gases to the cargo tanks so deficient in oxygen that the atmosphere within the tank may be rendered inert, i.e. incapable of propagating flame. (SOLAS 1974 II-2/62)
The oxygen content in the inert gas supply shall not normally exceed 5% by volume. (SOLAS 1974 II-2/62(k))
- 8.41 Are the vapour spaces in the cargo tanks being maintained at positive pressure?
- 8.42 Does the oxygen content in the cargo tanks meet IMO requirements?
- 8.43 Was the fixed oxygen analyser calibrated immediately prior to use of the inert gas system?
- 8.44 Do the readings on the local, bridge and cargo control room oxygen and pressure recorders, where fitted, agree?
Instrumentation shall be fitted for continuously indicating and permanently recording when inert gas is being supplied:
- *The pressure of the inert gas supply forward of the non-return devices; and*
 - *The oxygen content of the inert gas in the inert gas supply mains on the discharge side of the gas blowers.* (FSS Code 15.2.4.2.1)
- The devices referred to above shall be placed in the cargo control room. But where no cargo control room is provided, they shall be placed in a position easily accessible to the officer in charge of cargo operations.* (FSS Code 15.2.4.2.2)
- In addition, meters shall be fitted:*
- *In the navigation bridge to indicate at all times the pressure of the inert gas main forward of the non-return devices;*
 - *In the machinery control room or in the machinery space to indicate the oxygen content of the inert gas in the inert gas supply mains on the discharge side of the gas blowers.* (FSS Code 15.2.4.2.3)
- 8.45 Is the liquid level in the deck seal correct and clearly visible?
Comment if a dry-type deck seal is fitted.
- Notes: The OCIMF paper on inert gas deck seals recommends that a dry-type deck seal is best replaced with one of another type.*
Normally with a dry type seal there is a dump valve which should open when the inert gas supply is stopped and which allows the water from the upper tank to drain to the lower, thereby creating a seal. The crew should be requested to stop the inert gas momentarily (which will not affect cargo operations), to see if this process actually takes place. Upon restoring the supply, the dump valve should close and the upper tank filling and lower tank drain valves open.
- 8.46 Does the P/V breaker appear to be in good order?

Note: If the P/V breaker is filled with water, the liquid should be protected against freezing by the addition of an anti-freeze if the vessel is likely to encounter freezing conditions.

8.47 Can double hull spaces be inerted?

Tankers required to be fitted with inert gas systems shall be fitted with suitable connections for the supply of inert gas to double hull spaces. (SOLAS 2001 II-2/59.4.3 and SOLAS 2004 II-2/4.5.5.1.3)

This requirement applies to vessels constructed on or after 1st October 1994. (SOLAS 2001 II-2/59.4.1)

Crude oil washing:

8.48 Is the vessel fitted with a crude oil washing system?

Every new crude oil tanker of 20,000 tons deadweight and above shall be fitted with a cargo tank cleaning system using crude oil washing. (MARPOL Annex I/13(6))

8.49 Is crude oil washing being carried out on this occasion?

8.50 Is an approved Crude Oil Washing Operations and Equipment Manual provided?

8.51 If the vessel is crude oil washing, has a checklist been completed?

8.52 Is the person in charge of COW operations suitably qualified?

Where a person such as the master, the chief officer or the cargo control officer assumes overall charge of a crude oil wash he shall:

(a) Have at least one year's experience on oil tankers where his duties have included the discharge of cargo and associated crude washing. Where his duties have not included crude oil washing operations, he shall have completed a training programme in crude oil washing in accordance with IMO Resolution A.446 (XI);

(b) Have participated at least twice in crude oil wash programmes one of which shall be on the particular ship for which he is required to undertake the responsibility of cargo discharge. Alternatively, this latter participation may be acceptable if undertaken on a ship that is similar in all relevant respects; and

(c) Be fully knowledgeable of the contents of the Operations and Equipment Manual.

(IMO Crude oil washing systems 5.2)

8.53 Do records indicate that the crude oil washing system was pressure tested prior to use?

8.54 Do records indicate that oxygen readings of the tanks to be crude oil washed have been checked by portable meter and found to be within maximum permissible limits?

8.55 Has a crude oil washing plan been prepared and is it being followed?

8.56 Are crude oil washing line pressure gauges working?

8.57 Is the tank cleaning heater, where fitted, effectively isolated from the crude oil washing line?

8.58 Are any hydrant-type connections on the crude oil washing lines securely sealed?

Note: Either blanks or valves with caps should be fitted.

8.59 Are records maintained of previous COW operations?

Note: A record should be being maintained of all COW operations, including the tanks washed, the number of machines used, the time washing started and was completed, the washing pattern employed, the washing line pressure and the method employed to ensure that the tanks were dry.

8.60 Are cargo tanks crude oil washed in accordance with IMO requirements?

Before departure on a ballast voyage:

- Approximately one quarter of the cargo tanks shall be crude oil washed for sludge control purposes on a rotational basis in accordance with the procedures specified in the Operations and Equipment Manual. However, for these purposes, no tank need be crude oil washed more than once in every four months;*

- If it is considered that additional ballast in a cargo tanks or tanks may be required during the ballast voyage, the tank or tanks which may be used for this ballast shall be crude oil washed in accordance with the procedures in the Operations and Equipment Manual; and
- Ballast water shall not be put into cargo tanks that have not been crude oil washed.
(MARPOL Annex 1 13B (4), IMO Res. 446(XI) and amendments A.496(XII) and A.897(21))

Static electricity precautions:

Notes: When a tank is maintained in an inert condition, when static non-accumulator cargoes are being handled, or when it can be guaranteed that the tank atmosphere is non-flammable, no anti-static precautions are necessary.

Questions 8.61 to 8.68 should only be completed for vessels carrying static accumulator cargoes in non-inert tanks. If the cargo is not static accumulator or if the tanks are inerted, answer these questions 'NA'.

Static accumulator cargoes are all those except fuel with anti-static additive, heavy black fuel oils, crude oil, bitumen, alcohols and ketones.

8.61 Are precautions relating to maximum flow rates during initial loading being observed?

8.62 Are required relaxation periods being observed?

8.63 Are vapour locks fitted with full depth sounding pipes?

Note: Sounding pipes should extend the full depth of the tank, should be earthed to the structure at each end and should be slotted to prevent any pressure differential building up within the pipe. This will allow operations to be carried out at any time because it will not be possible for any significant electrical charge to accumulate on the surface of the liquid within the sounding pipe.

8.64 Are metal tapes and other gauging or sampling devices effectively bonded before being introduced into tanks?

Note: UTI tapes must be bonded before being introduced into tanks. UTI tapes which have quick couplings to connect the unit to the vapour lock will possibly not require bonding wires. However, the internal bonding of such units should be checked every six months in accordance with the manufacturer's requirements.

8.65 Are natural fibre ropes, as opposed to synthetic, used for dipping etc.?

Note: Dipping, ullaging or sampling with non-metallic equipment lowered on clean natural fibre line is therefore permissible at any time.

8.66 If portable tank cleaning hoses are used, are continuity tests carried out and the results recorded?

Notes: Portable tank washing hoses should have a bonding wire incorporated within them to ensure electrical continuity.

Hoses should be marked to allow identification. A record should be kept showing the date and the result of electrical continuity testing.

Hoses should be tested for electrical continuity in a dry condition prior to use for tank cleaning and the resistance should not exceed 6 ohms per metre length.

8.67 Are personnel aware of the hazards associated with tank cleaning after the carriage of volatile products?

Note: The recommendations contained in ISGOTT must be strictly observed.

8.68 Are personnel aware of the need to avoid the free fall of liquid into tanks?

Note: It is essential to avoid the free fall of water or slops into a tank which is not inerted.

Manifold arrangements:

8.69 Are the manifolds in satisfactory condition?

The following applies to vessels of 16,000 dwt and above:

The distance of the presentation flanges inboard from the ship's side should be 4600 mm.

(Recommendations for Manifolds 2.2)

The height of the centres of the presentation flanges above the deck should not exceed 2100 mm.

(Recommendations for Manifolds 2.3.2)

The working platform (the grating of the saveall) should be fitted to allow 900 mm between the level of the platform and the centres of the presentation flanges. (Recommendations for Manifolds 2.3.3)

- 8.70 Are manifold pressure gauges fitted outboard of the manifold valves on both sides of the vessel and are they in good order?**

Note: Manifold pressure gauges should be fitted to the spool pieces/reducers on the outboard side of the manifold valves.

- 8.71 Are pressure gauges also fitted to the offshore manifolds and regularly checked during cargo transfer for manifold valve leakage?**

- 8.72 Are manifold pressure gauges fitted with valves or cocks?**

- 8.73 Are manifold blank flanges of an equivalent rating to that of the manifold pipelines?**

Notes: It is generally accepted that steel blanks should be of the same thickness as the flanges to which they are attached, but this will not necessarily result in the pressure capability being the same as that of the associated pipework.

It is the pressure rating of the blank which is important and blanks made of materials such as titanium have a superior strength and may therefore be significantly thinner for the same pressure rating as a mild steel blank. If such blanks are fitted, documentation should be on board to prove that the pressure rating is adequate for the service.

- 8.74 If the vessel is fitted with vapour return manifolds, are they in good order?**

Note: To prevent the accidental connection of a cargo line, vapour manifolds should have a stud fitted at the 12 o'clock position and the blank flange should have a corresponding hole to receive the stud.

- 8.75 If the vapour return manifolds are designed for use at single buoy moorings, do they comply with requirements?**

Note: Vapour return system manifolds (VRSM) which are designed for use at single buoy moorings:

- Should be painted red/yellow/red;*
- Should be supported to the same strength as the cargo manifolds;*
- Hose rails at the ship's side should be of the same strength and construction throughout their length, extend beyond the VRSM to permit use at single buoy moorings and be fitted with stopper plates at both the forward and aft ends of the hose rail;*
- A closed chock should be fitted at the ship's side in line with the VRSM;*
- A cruciform bollard should be fitted in line, or nearly in line with the VRSM to allow securing of the VRS hose hang-off chain;*
- Two deck pad-eyes of size sufficient to secure 16" floating hose should be provided, one to either side of the line from the closed chock to the VRSM;*
- Means to thoroughly drain the VRSM should be provided at the lowest point in the VRS line to avoid risk of liquid carry-over into the floating hose.*

- 8.76 Does the vessel's piping system appear to be free of unauthorised inter-connections between cargo, bunker and ballast systems?**

Pump rooms:

- 8.77 On vessels with pump rooms, are they free of evidence of significant leaks from machinery, pipework, valve glands and instrumentation?**

- 8.78 Are bulkhead seals gas tight and, if required, well lubricated?**

- 8.79 Is the cargo pump room gas monitoring system in good order and regularly checked?**

All tankers shall be fitted, by the date of the first scheduled docking after 1st July 2002 but not later than 1st July 2005, with a system for continuous monitoring of the concentration of hydrocarbon gases. Sampling points or detector heads shall be located in suitable positions in order that potentially dangerous leakages are readily detected. When the hydrocarbon gas concentration reaches a pre-set level, which shall not be higher than 10% of the LEL, a continuous audible and visual alarm signal shall be automatically effected in the in the pump room and cargo control room to alert personnel to the potential hazard.

(SOLAS 2000 II-2/4.5.10.1.3 and 1.6.7)

The alarm shall be automatically effected in the pump room, engine control room, cargo control room and navigation bridge on vessels constructed on or after 1st July 2002. (SOLAS 2000 II-2/4.5.10.1.3)

Note: Existing systems having a pre-set level of not more than 30% LEL may be accepted on vessels constructed before 1st July 2002

8.80 Are pump rooms clean, tidy and free of combustible material?

8.81 Are the pump room bilges free of cargo product?

8.82 Is the level of lighting in the pump room adequate?

Cargo hoses:

8.83 If the vessel uses its own cargo hoses, are they in good order, pressure tested annually to their design working pressure and is a record of all hose tests and inspections maintained on board?

Note: Each hose should be marked with the test date and pressure, maximum working pressure and be individually numbered for identification purposes.

Cargo lifting equipment:

8.84 Are all cargo derricks, cranes and other lifting equipment properly marked and has periodical testing and inspection been carried out?

Notes: Cargo lifting equipment should be load tested every five years and thoroughly examined by a competent person annually. Other lifting equipment is not regulated except as usually required by class, but should be tested and examined under a similar regime. The minimum SWL for which testing is required is one tonne (1,000 kgs).

A Chain Register is not required, but there must be documentation supporting test and examination.

8.85 Are winches associated with lifting equipment in a satisfactory condition?

Note: Cargo derrick topping lifts should have a means of securing them, such as a locking pin or ratchet, to prevent the weight of the derrick being solely taken by the winch brake. Check that this is fitted and that it and any associated winches are in good condition.

Ship to ship transfer operations supplement - petroleum

If the vessel is equipped with specialised equipment for regular ship to ship transfer operations such as fenders and hoses, the fact should be recorded.

This supplement should be completed only for vessels which carry out ship to ship transfer operations in open water and it does not apply to vessels which only occasionally carry out such operations within port confines.

8.86 Are operator's procedures provided for ship to ship operations?

Procedures should follow the recommendations of the OCIMF/ICS STS Transfer Guide.

8.87 Have senior deck officers had open-water ship to ship transfer experience within the last 12 months?

8.88 Are sufficient closed fairleads and mooring bitts provided?

It is recommended that all fairleads used during STS transfer operations are of an enclosed type. Such fairleads should be strong enough to take the anticipated mooring loads and large enough to allow the mooring line (plus any soft rope and tackle) to pass through comfortably. (STS Guide 9.3)

It has been found that full strength enclosed fairleads and bitts for spring lines need to be positioned no more than 35 metres forward and aft of the cargo manifold. (STS Guide 9.3)

It is recommended that all tankers be fitted with an array of mooring bitts of sufficient strength on each side of the ship. (STS Guide 9.3)

In addition it is recommended that provision be made for securing fender lines. (STS Guide 9.3)

8.89 Are ship-to-ship transfer checklists completed?

The checklists should be used not only at the time of transfer but also when the operation is being planned. Adherence to check list procedures will ensure that the most important aspects of an operation are covered. The checklists are:

- 1 - Pre-fixture information;
- 2 - Before operations commence;
- 3 - Before run-in and mooring;
- 4 - Before cargo transfer; and
- 5 - Before unmooring.

(STS Guide 3.3 and Appendix 1)

- 8.90 If a ship-to-ship transfer was in progress during the inspection, was it conducted in accordance with the recommendations of the OCIMF/ICS STS Transfer Guide?**

Combination carrier supplement

Note: Under normal circumstances, the inspection of combination carriers should be conducted only when the vessel is operating in the 'wet' mode.

- 8.91 Are operator's procedures provided and are records maintained for changing between the wet and dry modes?**

Note: Records should contain details of tank inspections and corrective actions taken, if required, after the carriage of dry cargoes with regard to damage caused by discharging equipment.

- 8.92 Have the senior deck officers had at least one years' experience operating in wet service?**

- 8.93 Are hatch covers of the dual seal type, are they seated correctly and are they sealed and gas tight?**

Notes: Hatches should be free of additional sealing such as tape or silicone sealant.

It is recommended practice that OBO's arrive at a terminal with a minimum tank vapour space pressure of 500 mm.

*Refer to the publication **Testing Requirements for Bulk Carriers**.*

- 8.94 Are hatch covers free of visible evidence of damage and are the corners of hatch coamings and adjacent decks free of visible cracks?**

- 8.95 Do records indicate that the pipe tunnel is clean and free of evidence of leakage?**

- 8.96 Are bilge pumping systems for forward spaces in good order?**

The means for draining and pumping ballast tanks forward of the collision bulkhead and bilges of dry spaces any part of which extends forward of the foremost cargo hold, shall be capable of being brought into operation from a readily accessible enclosed space, the location of which is accessible from the navigation bridge or propulsion machinery control position without traversing exposed freeboard or superstructure decks. (SOLAS 2002 XII/13.1)

- 8.97 Is the vessel equipped with bilge alarms in the forward spaces and holds?**

Bulk carriers shall be fitted with water level detectors:

- *In each cargo hold giving visual and audible alarms, one when the water level above the inner bottom in any hold reaches a height of 0.5 metres and another at a height of not less than 15% of the depth of the cargo hold;*
- *In any ballast tank forward of the collision bulkhead, giving an audible and visual alarm when the liquid in the tank reaches a level not exceeding 10% of the tank capacity;*
- *In any dry or void space other than a chain cable locker, any part of which extends forward of the foremost cargo hold, giving an audible and visual alarm at a water level of 0.1 metre above the deck. Such alarms need not be provided in enclosed spaces the volume of which does not exceed 0.1% of the ship's maximum displacement volume.* (SOLAS 2002 XII/12.1)

The audible and visual alarms shall be located on the navigation bridge. (SOLAS 2002 XII/12.2)

Bulk carriers constructed before 1st July 2004 shall comply with the requirements not later than the date of the annual, intermediate or renewal survey of the ship to be carried out after 1st July 2004, whichever comes first. (SOLAS 2002 XII/12.3)

- 8.98 If the vessel uses portable hoses for crude oil washing, are these in a satisfactory condition and do records support that they have been regularly tested.

Shuttle tanker supplement

Notes: These questions address issues associated with tankers that are provided with specialist equipment for operations at deep water terminals and FPSO's. This section should only be completed when the vessel has such equipment.

Unless the inspection is taking place at an offshore installation it may not be possible for the inspector to provide detailed responses relating to these vessels, or to answer some of the questions. Operators with offshore installations have specific inspection questionnaires that address their more detailed requirements.

Ascertain that the vessel is provided with full operating requirements for each of the offshore terminals to which it trades.

Personnel management:

- 8.99 Have senior deck officers had at least one year's experience in shuttle tanker operations?
- 8.100 Are senior deck officers experienced and qualified in dynamic positioning operations?
- 8.101 Have junior deck officers attended dynamic positioning courses?
- 8.102 Do all deck officers attend dynamic positioning refresher training at intervals not exceeding two years?
- 8.103 Have officers and ratings had shore-based training in helicopter handling operations?

Dynamic positioning and navigation equipment:

- 8.104 If the vessel is equipped with dynamic positioning, is it in good order?
- 8.105 Has a Failure Mode Effect Analysis (FMEA) been carried out?
Note: The report from the FMEA should be available on board.
- 8.106 Where dynamic positioning equipment has been installed or modified, was the FMEA updated?
- 8.107 Are all position reference systems in good order?
Note: Reference systems include Hydro acoustic position reference (HPR), High Precision Acoustic Positioning (HiPAP), Artemis (very short wave radar), Differential GPS (DGPS), Diffstar Absolute Relative Position System (DARPS) and Fanbeam.
- 8.108 Is there a procedure for the regular checking of the uninterrupted power supply systems?
- 8.109 Are all the thrusters in good order?
Note: Routines for calibrating the thrusters should either be a part of the annual dynamic positioning trials or included in the planned maintenance system.

Cargo operations:

- 8.110 Are the appropriate loading terminal procedures manuals on board for each offshore terminal to which the vessel trades?
- 8.111 Are weather forecasts received and assessed before commencing offshore operations?
- 8.112 Are records of regular communications checks with the installation maintained?
- 8.113 Are deck officers familiar with these procedures?

- 8.114 Is there a checklist for bridge or bow control station instrumentation and control systems and has it been correctly completed?
- 8.115 Is there a checklist for engine room machinery and has it been correctly completed?
- 8.116 Does the vessel apply the same practices when loading from the offshore terminal as for an on-shore terminal?
Note: Specific procedures should be provided for each of the terminals at which the vessel operates.
- 8.117 Are green line interlocks working satisfactorily?
- 8.118 Is there a service report available for the tension load cells?
- 8.119 Is the deluge system in good order and is it pressurised during loading?
- 8.120 Are the emergency shut-down systems in good order and tested regularly?
- 8.121 Is the telemetry working and tested?

Bow Loading Systems (BLS) and Submerged Turret Loading (STL) operations:

- 8.122 Are the BLS and/or STL systems in good order?
- 8.123 Are checklists for the operation of the BLS and/or STL systems available?
- 8.124 Are seals on the STL buoy hatch and the STL room watertight door in good order?
- 8.125 Is the alarm for the STL room watertight door in good order and tested regularly?
- 8.126 Are indicators for closing devices in good order?
- 8.127 Are these areas fitted with fire detection and extinction arrangements and with gas and video monitoring and is the equipment in good order?

Safety management at offshore installations:

Note: Questions 8.128 - 8.137 can only be completed if the vessel is at an offshore installation.

- 8.128 Have communications been established and is there a back up communication system?
- 8.129 Have communications been established with the field standby vessel?
- 8.130 Are written emergency procedures for offshore loading provided?
- 8.131 Are drills pertaining to these procedures held regularly?
- 8.132 Is there a procedure for emergency towing?
- 8.133 Are emergency towing trials carried out regularly?

Pollution prevention specific to offshore installations:

- 8.134 Does the SOPEP address procedures specific to shuttle tanker operation?
- 8.135 Are BLS and/or STL spaces free of oil?
- 8.136 If an oil discharge monitor is fitted in the STL room, is it in good order?

8.137 Is the vessel equipped with an appropriate system for draining the BLS and/or STL spaces?

Additional comments:

If the Inspector has comments in respect of the subject matter covered by the Chapter additional to those which the Inspector may make in response to the specific key questions in the Chapter, the Inspector should include such additional comments in this section.

Chapter 8. Cargo and ballast systems – chemical

Notes: This chapter can only be completed if the vessel is provided with a Certificate of Fitness (excluding a Noxious Liquid Substances Certificate). The vessel must be carrying chemicals at the time of the inspection.

However, in exceptional circumstances and with the express permission of the inspector's principals, a chemical carrier which regularly carries chemicals and for a brief period is not actually carrying them at the time of the inspection, may be inspected as a chemical carrier provided that an adequate assessment of the procedures on board for the carriage of chemicals can be made. In such circumstances it must be made clear in the report what has taken place.

In answering the questions below, note that the IBC Code applies only to those vessels where the keel was laid on or after 1st July 1986.

The BCH code applies to vessels whose keel was laid or which were at a similar stage of construction on or after 12th April 1972. It also applies to vessels constructed before this date, except for the construction provisions of BCH 1.7.3 (a) to (f).

Policies, procedures and documentation:

- 8.1 Is the vessel provided with company policy statements, instructions and procedures with regard to safe cargo operations?**
- 8.2 Is information readily available on maximum loading rates and venting capacities?**
Note: The information should be displayed in the cargo control area.
- 8.3 Are legible and up to date pipeline and/or mimic diagrams of cargo, inert gas and venting systems available in the cargo control area?**
- 8.4 Is there a Procedures and Arrangements Manual available?**
Notes: The list of cargoes which the vessel is allowed to carry attached to the Certificate of Fitness will include Appendix III substances, but that in the P and A Manual will not.
The form of the list in the P and A Manual is different to that attached to the Certificate of Fitness in that it contains information on miscibility (the percentage of the product which is soluble in water) and whether cargoes are suitable for cleaning by ventilation. That in the Certificate of Fitness contains the conditions of carriage.
- 8.5 Is the Cargo Record Book correctly completed and up to date?**
A Cargo Record Book is required when carrying chemicals under either a Certificate of Fitness or a NLS Certificate.
- 8.6 Are there procedures for tank cleaning after flammable and toxic products, using chemicals and solvents, gas freeing and for steaming cargo tanks?**
- 8.7 Are tank cleaning guidelines available?**
Notes: Tank cleaning is one of the most hazardous operations in chemical tankers and it is therefore essential that a comprehensive guide is available on board.
Some major chemical tanker operators have developed their own comprehensive tank cleaning guidelines and these should be reviewed. If they have not, a recognised professionally produced industry publication should be available on board.

Stability and cargo loading limitations:

The master of the ship should be supplied with a loading and stability information booklet. This booklet should contain details of typical service and ballast conditions, provisions for evaluating other conditions of loading and a summary of the ship's survival capabilities. In addition, the booklet should contain sufficient information to enable the master to load and operate the ship in a safe and seaworthy manner. (IBC 2.2.5)

- 8.8 Have stability calculations and where applicable stress calculations, been performed for the current cargo operation?**

- 8.9 Is the stress and stability information included with the cargo plan and are any limitations understood by the cargo watch officers?
- 8.10 Are damage stability guidelines available?
Note: Damage stability is assessed under the requirements of the IBC Code Chapter 2.5 and the stability booklet should contain information on the ship's survival capabilities.
- 8.11 Is the master aware of the worst damage stability condition in the stability book?
- 8.12 Is the vessel free of inherent intact stability problems?
Notes: Vessels which have large width tanks will be subject to reductions of intact stability due to free surface. Although such vessels may meet IMO intact stability criteria when in fully loaded or ballasted conditions, they may be unstable when multiple tanks are slack during cargo or ballast transfer operations, or in intermediate states of loading. Trim and stability manuals generally deal only with arrival and departure conditions and operators are not made aware that stability problems may exist at intermediate stages during cargo transfers.
If a vessel has either large width cargo tanks, U section ballast tanks, or double bottom tanks without watertight centreline bulkheads. Attempt to ascertain if the vessel meets IMO intact stability criteria by requesting the chief officer to demonstrate, using the loading instrument, the intact stability of the worst case condition (all tanks slack and maximum free surface).
If there is no suitable loading instrument and adequate instructions are not available, the key question should be answered 'No', unless there is satisfactory proof that the vessel is free of inherent stability problems.
- 8.13 If a loading computer or programme is in use, is it class approved?
If a class approved loading computer is not available, comment as to how stress and stability calculations are performed.
Notes: Class requirements are that ships of more than 65 metres in length shall be provided with an approved type loading instrument. Ships with very limited possibilities for variations in the distribution of cargo and ballast and ships with a regular or fixed trading pattern may be exempt from the requirement. The loading instrument is to be capable of calculating shear forces and bending moments, in any load or ballast condition at specified readout points and is to indicate the permissible values.
- 8.14 Are there records indicating that the operational accuracy of the load computer is tested regularly?
Note: Class approved data should be used and the tests should be carried out at least quarterly.
- 8.15 Are longitudinal stresses, where applicable, maintained within design limits throughout?
- 8.16 Are cargo and/or ballast tanks free of sloshing or weight restrictions?
Detail any important restrictions, other than those normally applied such as maximum density.
- 8.17 Where applicable, are officers aware of the dangers of high free surface effects and of the possibility of structural damage caused by sloshing in cargo tanks?
- 8.18 Do the operator's operating manuals include procedures for restoring stability in case of unstable conditions developing during cargo operations, where applicable?

Cargo operations and related safety management:

- 8.19 Are the cargoes being carried listed on the Certificate of Fitness?
Note: If the cargo being carried is not listed on the Certificate of Fitness, there must be authorisation from the administration or their representative allowing the product to be carried.
- 8.20 Are all officers familiar with the cargo system?
- 8.21 Are all officers familiar with the carriage requirements for the cargoes on board and chemicals in general?

Note: Officers should be able to demonstrate a basic knowledge of the following:

- *Shipboard operations and cargo handling;*
- *Closed loading, discharging and sampling;*
- *The meaning of Category A, B, C and D cargoes;*
- *The IBC and BCH Codes, where applicable;*
- *Requirements for medical treatment following exposure to hazardous cargoes;*
- *Spill response;*
- *Communication procedures with shore and emergency stop procedures.*

And, as required:

- *Drying, padding and inerting;*
- *Precautions for reactive and self-reactive cargoes;*
- *Limitations when loading high density cargoes;*
- *Hazards associated with corrosive cargoes;*
- *Hazards associated with toxic cargoes;*
- *Hazards of electrostatic generation;*
- *Hazards associated with handling nitrogen;*
- *Handling solidifying and high viscosity cargoes;*
- *Pre-wash requirements.*

8.22 When an unfamiliar chemical is to be carried, is there a procedure to review the safety aspects and handling procedures?

Note: For each chemical carried a review of the carriage requirements should have been made in order to ensure that the cargo plan contains all the necessary information for the safe carriage of the product.

The review should reference:

- *The IBC Code Chapter 17;*
- *The Certificate of Fitness;*
- *The P and A Manual; and*
- *Material Safety Data Sheets.*

8.23 Is a cargo compatibility chart available?

8.24 Has a cargo handling plan been prepared which provides a detailed sequence of cargo and ballast transfer?

Note: The plan should cover all stages of the transfer operations, namely:

- *Quantity and grade of each parcel;*
- *Density, temperature and other relevant properties;*
- *A plan of the distribution, lines and pumps to be used;*
- *Transfer rates and maximum allowable pressures;*
- *Cargo pollution category;*
- *Flammability and toxicity;*
- *Fire protection including fire fighting agent;*
- *Miscibility;*
- *Critical stages of the operation;*
- *Notice of rate change;*
- *Venting requirements;*
- *Stability and stress information;*
- *Drafts and trims;*
- *Ballast operations;*
- *Emergency stop procedures;*
- *Action to be taken in the event of a spill;*
- *Protective equipment requirements; and*
- *Hazards of the particular cargoes.*

And also, as required:

- *Inerting and padding;*
- *Cargo viscosity;*
- *Cargo melting point;*
- *Cooling;*
- *Tank coating material compatibility;*
- *Precautions against static generation;*
- *Control of cargo heating systems;*
- *Line clearing;*

- *Under keel clearance limitations;*
- *Bunkering; and*
- *Special precautions required for the particular operation.*

8.25 Has the plan been signed by the watch officers to indicate their understanding of it?

8.26 Are cargo operations being carried out and logged in accordance with the plan?

8.27 If the cargo is required to be inhibited, is the required information available?

Certain cargoes with a reference in column 'o' of Chapter 17, by the nature of their chemical make-up, tend, under certain conditions of temperature, exposure to air or contact with a catalyst, to undergo polymerisation, decomposition, oxidation or other chemical changes. Mitigation of this tendency is carried out by introducing small amounts of chemical additives into the liquid cargo or controlling the tank environment. (IBC 15.13.1)

Care should be taken to ensure that these cargoes are sufficiently protected to prevent deleterious chemical change at all times during the voyage. Ships carrying such cargoes should be provided with a certificate of protection from the manufacturer and kept during the voyage, specifying:

- *The name and amount of additive present;*
- *Whether the additive is oxygen dependent;*
- *Date the additive was put in the product and the duration of its effectiveness;*
- *Any temperature limitations qualifying the additive's effective lifetime; and*
- *The action to be taken should the length of the voyage exceed the effective lifetime of the additives. (IBC 15.13.3)*

8.28 Are the dangers associated with co-mingling non-compatible cargoes in slop tanks and drip trays considered?

Note: The cargo plan should identify when care should be taken to avoid the co-mingling of non-compatible cargoes and which cargoes are involved.

8.29 Are Material Safety Data Sheets (MSDS) on board for all the products being handled and are all officers familiar with their use?

Note: There should be an MSDS posted for each product the vessel is carrying.

8.30 Are all officers aware of the emergency procedures for dealing with leakage, spillage or fire involving the cargo?

Officers should be trained in emergency procedures to deal with conditions of leakage, spillage or fire involving the cargo and a sufficient number of them should be instructed and trained in essential first aid for cargoes carried. (IBC 16.3.3)

8.31 Is the verbal communication between the ship and the shore adequate?

8.32 Is a tank cleaning plan established prior to cleaning operations?

Notes: Adequate planning of cleaning operations is crucial to the successful carriage of chemicals and to the avoidance of rejection of tanks, contamination of cargo and incidents. The two most important criteria are the previous and the next cargoes and these two factors will determine the level of cleaning required.

Planning should embrace not only the method of cleaning required, but should also ensure that all parts of the cargo system which were in contact with the previous cargo are cleaned, including the tank walls, pumps, cofferdams and exhaust traps, stripping system, cargo and vent lines, cargo valves, p/v valves, sounding pipes, stub pipes and dead ends etc.

The plan should detail, for each of the pre and final cleaning steps:

- *The previous and following cargoes;*
- *The condition of the cargo tank to be cleaned and whether toxic or flammable vapour is present, or whether lack of oxygen should be suspected;*
- *Any precautions necessary with respect to the condition of the tank;*
- *The cleaning method, whether butterworthing, recirculation, rinsing, steaming, ventilating, or drying;*
- *The cleaning medium, whether sea, fresh, treated or demineralised water, or a chemical or solvent;*

80

- Which cleaner, if any, to be used, its concentration and whether it is to be injected, recirculated or hand sprayed;
- The washing temperature required to be maintained;
- The length of cleaning time required;
- Slop disposal requirements;
- Wall wash test requirements, if any;
- Any relevant additional instructions, including protective equipment requirements; and
- The action to be taken in the event of an emergency.

8.33 Are officers aware of the dangers associated with tank cleaning operations after the carriage of volatile or toxic products?

8.34 Have satisfactory column/cofferdam purging routines been established where deep well pumps are fitted?

8.35 Where cargo tanks are of stainless steel are there procedures for passivation and pickling?

Notes: Passivation and pickling are acid treatments applied to the surface of stainless steel tanks to aid the formation of a continuous passive chromium oxide film. The surfaces of stainless steel tanks should be regularly checked, generally using a palladium chloride test, for an intact passive film.

Passivation is removal of contaminants from the surface of stainless steel. The most common treatment is nitric acid solution, although care should be exercised in selecting the treatment to ensure that the contaminant is adequately targeted.

Pickling is the removal of scale and oxide layers on the surface of the tank, generally the result of heating the metal through welding or other heat treatments, by the application of nitric or hydrofluoric acid, although other specialised applications exist. The application restores the chromium oxide film.

It is essential that the passivation or pickling acid is thoroughly removed after the process is completed. Residual hydrofluoric acid will initiate pitting corrosion.

8.36 Are adequate procedures in place for carrying out wall wash tests?

Notes: Wall wash tests are carried out on the bulkheads of cargo tanks. There are many types including chloride, colour, chemical oxygen demand, methanol, non volatile matter, permanganate time and water miscibility tests.

Procedures should include the use of protective equipment where required.

8.37 Is the cargo sample locker situated within the main cargo area and is it in a satisfactory condition?

Samples which have to be kept on board should be stowed in a designated space situated in the cargo area, or, exceptionally, elsewhere, subject to the approval of the administration. (IBC 16.5.1)

Note: Only if the locker contains flammable liquids are SOLAS fire extinguishing arrangements required.

8.38 Is the cargo sample locker suitably constructed to prevent breakages?

The stowage space should be:

- Cell divided in order to avoid shifting of the bottles at sea;
- Made of material fully resistant to the different liquids intended to be stowed; and
- Equipped with adequate ventilation arrangements. (IBC 16.5.2)

Samples which react with each other dangerously should not be stowed close to each other. (IBC 16.5.3)

Samples should not be retained on board longer than necessary. (IBC 16.5.4)

8.39 Is the cargo sample locker adequately ventilated?

Note: Mechanical ventilation is not required.

Cargo handling and monitoring equipment:

8.40 Are the following, where fitted, in good order and is there evidence of regular testing?

Cargo, ballast and stripping pumps, eductors and their associated	
---	--

instrumentation and controls;	
Cargo and ballast pump bearing, casing and shaft gland temperature monitoring;	<p><i>On vessels constructed on or after 1st July 2002, cargo pumps, ballast pumps and stripping pumps, installed in cargo pump rooms and driven by shafts passing through pump room bulkheads shall be fitted with temperature sensing devices for bulkhead shaft glands, bearings and pump casings. A continuous audible and visual alarm signal shall be automatically effected in the cargo control room or the pump control station.</i></p> <p style="text-align: right;"><i>(SOLAS 2004 II-2/4.5.10.1.1)</i></p> <p><i>All other tankers shall be fitted with the above temperature sensing devices by the date of the first scheduled docking after 1st July 2002 but not later than 1st July 2005.</i></p> <p style="text-align: right;"><i>(SOLAS 2004 II-2/1.6.7)</i></p> <p><i>Notes: There is only a requirement to provide an alarm. There is no requirement for temperatures to be displayed, or for a high temperature trip to operate.</i></p> <p><i>Cargo pump bearings should not have temporary cooling fitted.</i></p>
Cargo vapour and inert gas lines;	
Emergency cargo pump and associated hoses;	
Cargo pump emergency shut down system;	<i>Pump alarms and trips, level alarms, etc., where fitted, should be tested regularly to ensure that they are functioning correctly, and the results of these tests should be recorded.</i>
Cargo and ballast system valves;	
Cargo system ullage gauges, vapour locks and UTI tapes;	
Remote and local temperature and pressure sensors and gauges;	
Cargo tank high level and overflow alarms.	

8.41 Are pipeline drains and stub pieces valved and capped and in a satisfactory condition?

8.42 Are cargo line drains suitably positioned to preclude liquid remaining in the line after draining?

8.43 Are cargo pipelines tested annually?

Note: Cargo pipelines should be tested to 1.25 times their designed working pressure at least annually and be marked with the date of test and the pressure.

8.44 Is the cargo tank high level alarm system independent of both the gauging devices and the overflow-control alarm system?

Cargo tanks should be fitted with a visual and audible high-level alarm which indicates when the liquid level in the cargo tank approaches the normal full condition (95%). *(IBC 15.19.6)*

The high level alarm system should be independent of the overflow-control system and should be independent of the gauging system. *(IBC 15.19.5)*

A tank overflow control system should:

- *Come into operation when the normal tank loading procedures fail to stop the liquid level exceeding the normal full condition;*
- *Give a visual and audible tank-overflow alarm to the ship's operator; and*
- *Provide an agreed signal for sequential shutdown of onshore pumps or valves or both and of the ship's valves. The use of shipboard automatic closing valves should be permitted only when specific approval has been obtained from the administration and the port State authority concerned.* *(IBC 15.19.7)*

Note: High level alarms are required where 15.19.6 is indicated in column 'o' of Chapter 17 and overflow alarms where 15.19.7 is indicated.

8.45 Is the high level alarm system operated during both loading and discharging?

8.46 Are there records of the calibration of key cargo instrumentation, including temperature and pressure gauges?

Notes: There should be records of the regular checking and calibration of instrumentation, particularly cargo tank temperature and pressure gauges. Calibration should be carried out preferably at intervals not exceeding 30 months.

Calibration of instrumentation is often difficult whilst the vessel is in service and it is usually carried out during repair periods. However, comparisons between local and remote thermometer readings provide a practical cross-reference.

8.47 Is the inert gas system and/or storage and associated pipework, where fitted, in good order?

8.48 Is the general condition of the cargo tank heating system satisfactory?

Ullaging, sampling and closed operations:

8.49 Are vapour locks, where fitted, calibrated and certified by a recognised cargo inspection organisation?

Note: Corrections for datum levels and for list and trim should be checked and approved by the authority if ullages from vapour locks are used for cargo calculation.

8.50 If fixed tank gauges are not fitted, are there sufficient portable tapes to gauge every tank being worked simultaneously?

Notes: Occasionally personnel do not trust the reliability of the tank gauging system and use the vapour locks as the main method of ullaging, in which case this question applies.

UTI tapes constitute a restricted type of gauging and should not be used for closed operations with toxic cargoes.

There should also be two spare tapes on board.

8.51 Is the vessel capable of operating in a closed condition if volatile or toxic products are handled, including ullaging and sampling?

All tankers fitted with a fixed inert gas system shall be provided with a closed ullage system.

(SOLAS 1974 II-2/60.7 and SOLAS 2004 II-2/4.5.5.3.3)

Notes: A volatile product is petroleum having a flash point below 60°C as determined by the closed cup method of testing.

If a cargo is being handled at a temperature within 10°C of its flashpoint, it should be considered volatile. Therefore a cargo with a flashpoint of 80°C should be considered volatile if handled at a temperature of 70°C or above.

Open and restricted gauging should be allowed only where:

- *Open venting is allowed by the Code; or*
- *Means are provided for relieving tank pressure before the gauge is operated. (IBC 13.1.3)*

8.52 If the vessel is handling volatile or toxic cargoes, is it operating in a closed condition at the time of the inspection?

8.53 Do tank hatches, tank cleaning apertures and sighting ports appear to be liquid and gas tight?

Venting arrangements:

8.54 Is the cargo venting system in a satisfactory condition?

Note: The condition of p/v valves, mast risers, vent stacks, vapour lines, vacuum valves and flame screens should be assessed.

8.55 Is the cargo venting system being operated correctly?

8.56 Are SOLAS secondary venting requirements being complied with?

The IBC Code requires:

Controlled tank venting systems should consist of a primary and a secondary means of allowing full flow relief of vapour to prevent over-pressure or under-pressure in the event of failure of one means.

Alternatively, the secondary means may consist of pressure sensors fitted in each tank with a monitoring system in the ship's cargo control room or position from which cargo operations are normally carried out. Such monitoring equipment should also provide an alarm facility which is activated by the detection of over-pressure or under-pressure conditions within a tank. (IBC 2002 amendments 8.3.3)

Note: These requirements apply to ships constructed on or after 1st July 2002. Ships constructed on or after 1st July 1986 but before 1st July 2002 should comply with the requirements by the date of the first scheduled dry-docking after 1st July 2002, but not later than 1st July 2005. (IBC 2002 amendments 8.1.6)

8.57 Are the P/V valves in good order, inspected and cleaned as part of a regular maintenance routine and are there records to support this?

Notes: High jet cones and flaps should not be jacked open, particularly when loading.

Verify that p/v valves, where fitted, are tight and in a satisfactory condition.

High jet vents are not fitted with flame screens and their correct operation relies on a pressure build-up within the compartment which opens the valve at a predetermined level and results in a gas exit velocity of a minimum of 30 metres/sec. This results in protection against the passage of flame, the speed of which is about 7.5 metres/sec.

Consistent with safety and without interfering with operations and if appropriate to the design of the venting equipment, request the manual lifting of p/v valves to demonstrate satisfactory operation.

P/v valves should be checked for free movement prior to the commencement of each cargo operation as required by the Ship to Shore Safety Check List question 18.

8.58 Are flame screens easily accessible and removable, in good order and inspected and cleaned as part of a regular maintenance routine and are there records available?

Note: The vacuum valve of a p/v valve will be fitted with a flamescreen.

8.59 If the vessel is operating with a vapour return line connected, are appropriate transfer procedures in place?

Note: Particular attention should be paid to monitoring the pressure in the cargo tanks and the associated line system. P/v valves, the ullaging system and the level alarms should have been thoroughly tested prior to the transfer commencing and there should be awareness of the initial transfer rate and maximum allowable transfer rates. It is recommended that the internal tank pressure does not exceed 80% of the p/v valve opening pressure.

Static electricity precautions:

Notes: When a tank is maintained in an inert condition, when static non-accumulator cargoes are being handled, or when it can be guaranteed that the tank atmosphere is non-flammable, no anti-static precautions are necessary.

Questions 8.60 to 8.67 should only be completed for vessels carrying static accumulator cargoes in non-inert tanks. If the cargo is not a static accumulator or if the tanks are inerted, answer these questions 'NA'.

Static accumulator petroleum cargoes are all those except crude oils, residual fuel oils, black diesel oils and asphalts (bitumens). Some chemicals are known static accumulators and examples are Cumene, Cyclohexane, Diethylether, Heptanes, MTBE, Nonene, Octenes, Styrene, Toluene and Xylene. In case of doubt it should be assumed that a product is a static accumulator and the appropriate precautions should be taken.

8.60 Are precautions relating to maximum flow rates during initial loading being observed?

Depending upon the trade of the tanker, a number of loading rates need to be determined for each cargo tank. These loading rates will be dependent on the maximum flow rates in the cargo lines for different products and loading operations. In general, the following flow rates may need to be calculated for each section of the cargo system.

- A loading rate based on a linear velocity of 1 metre/second at the tank inlet for the initial loading rate for static accumulator cargoes into non-inerted tanks.*
- A loading rate based on a linear velocity of 7 metres/second for bulk loading static accumulator cargoes into non-inerted tanks.*
- A loading rate based on a linear velocity of 12 metre/second for loading non-static accumulator cargoes and also for loading static accumulator cargoes into inerted tanks. This velocity is*

provided for guidance only and is generally considered as a rate above which pipeline erosion may occur at pipe joints and bends.

8.61 Are required relaxation periods being observed?

8.62 Are vapour locks fitted with full depth sounding pipes?

Note: Where vapour locks are fitted, full depth sounding pipes should be fitted from deck level to the bottom of the tank. If not, static precautions must be taken, in particular allowing a relaxation period before taking ullages.

8.63 Are metal tapes and other gauging or sampling devices effectively bonded before being introduced into tanks?

Note: UTI tapes must be bonded before being introduced into tanks. UTI tapes which have quick couplings to connect the unit to the vapour lock will possibly not require bonding wires. However, the internal bonding of such units should be checked every six months in accordance with the manufacturer's requirements.

8.64 If portable tank cleaning hoses are used, are continuity tests carried out and the results recorded?

Notes: Portable tank washing hoses should have a bonding wire incorporated within them to ensure electrical continuity.

Hoses should be marked to allow identification. A record should be kept showing the date and the result of electrical continuity testing.

Hoses should be tested for electrical continuity in a dry condition prior to use for tank cleaning and the resistance should not exceed 6 ohms per metre length.

8.65 Are personnel aware of the hazards associated with tank cleaning after the carriage of volatile products?

Note: The recommendations contained in ISGOTT must be strictly observed.

8.66 Are personnel aware of the hazards associated with steaming cargo tanks after the carriage of volatile products?

8.67 Are personnel aware of the need to avoid the free fall of liquid into tanks?

Note: It is essential to avoid the free fall of water or slops into a tank which is not inerted.

8.68 Are cargo pipe joints bonded?

All gasketed cargo pipe joints and hose connections should be electrically bonded. (IBC 10.3)

Note: Some gaskets are electrically conductive and bonding is not required.

Manifold arrangements:

8.69 Are cargo manifold arrangements satisfactory?

8.70 Are manifold pressure gauges fitted outboard of the manifold valves and are they in good order?

8.71 Are pressure gauges also fitted to the offshore manifolds and regularly checked during the discharge for manifold valve leakage?

8.72 Are manifold pressure gauges fitted with valves or cocks?

8.73 Are all flange connections fully bolted?

Note: This includes any line which is being used for, or might become pressurised during, cargo operations on both sides of the vessel.

8.74 Are manifold blank flanges of an equivalent rating to that of the manifold pipelines?

Notes: It is generally accepted that steel blanks should be of the same thickness as the flanges to which they are attached, but this will not necessarily result in the pressure capability being the same as that of the associated pipework.

It is the pressure rating of the blank which is important and blanks made of materials such as titanium have a superior strength and may therefore be significantly thinner for the same pressure rating as a mild steel blank. If such a blank is fitted, there must be documentation on board to prove that the pressure rating is adequate for the service.

- 8.75 Are the manifold valves and lines marked to identify the tank or tanks they serve?
- 8.76 Are the manifolds fitted with drain lines and purge points and are they valved and capped?
- 8.77 Is the vessel free of unauthorised inter-connections between cargo, bunker and ballast systems?

Cargo pump room:

- 8.78 On vessels with pump rooms, are they free of evidence of significant leaks from machinery, pipework, valve glands and instrumentation?

- 8.79 Are bulkhead seals gas tight and, if required, well lubricated?

- 8.80 Is the cargo pump room gas monitoring system in good order and regularly checked?

All tankers shall be fitted, by the date of the first scheduled docking after 1st July 2002 but not later than 1st July 2005, with a system for continuous monitoring of the concentration of hydrocarbon gases. Sampling points or detector heads shall be located in suitable positions in order that potentially dangerous leakages are readily detected. When the hydrocarbon gas concentration reaches a pre-set level, which shall not be higher than 10% of the LEL, a continuous audible and visual alarm signal shall be automatically effected in the pump room and cargo control room to alert personnel to the potential hazard.

(SOLAS II-2/1.6.7)

The alarm shall be automatically effected in the pump room, engine control room, cargo control room and navigation bridge on vessels constructed on or after 1st July 2002.

(SOLAS II-2/4.5.10.1.3)

Note: Existing systems having a pre-set level of not more than 30% LEL may be accepted.

- 8.81 Is the bilge pump in good order and can it be operated from a position outside the pump room?
- 8.82 Are discharge pressure gauges provided outside where a cargo pump room is fitted and are they in good order?

Safety equipment:

- 8.83 Is the vessel provided with the protective equipment required by the IBC or BCH Codes?

For the protection of crew members engaged in cargo operations, the ship should have on board suitable protective equipment consisting of large aprons, special gloves with long sleeves, suitable footwear, coveralls of chemical-resistant material and tight fitting goggles or face shields or both. The protective clothing and equipment should cover all skin so that no part of the body is unprotected.

(IBC 14.1.1)

Work clothes and protective equipment should be kept in easily accessible places and in special lockers. Such equipment should not be kept within accommodation spaces, with the exception of new, unused equipment and equipment which has not been used since undergoing a thorough cleaning process. The administration may, however, approve storage rooms for such equipment within accommodation spaces if adequately segregated from living spaces such as cabins, passageways, dining rooms, bathrooms etc.

(IBC 14.1.2)

Note: This protective equipment is required for all chemical carriers.

- 8.84 Is the vessel provided with the safety equipment required by the IBC or BCH Codes?

Ships carrying toxic cargoes, identified by 15.12, 15.12.1 or 15.12.3 in column 'o' of Chapter 17 should have on board sufficient but not less than three complete sets of safety equipment, each permitting personnel to enter a gas-filled compartment and work there for at least 20 minutes.

(IBC 14.2.1)

One complete set of safety equipment should consist of:

- *One self contained air-breathing apparatus;*

86

- Protective clothing, boots, gloves and tight fitting goggles;
- Fireproof line with belt resistant to the cargoes carried; and
- An explosion-proof lamp. (IBC 14.2.2)

Note: For vessels carrying toxic cargoes, the safety equipment referred to above should provide full protection. The suits themselves should be capable of providing adequate protection against the product and they should be fitted with integral gloves and boots. Such suits are not required if the vessel does not carry toxic cargoes.

8.85 Is the safety equipment correctly located?

At least one set of safety equipment should be kept in a suitable clearly marked locker in a readily accessible place near the cargo pump room. The other sets should also be kept in suitable, clearly marked, easily accessible places. (IBC 14.2.5)

8.86 Is the safety equipment required by the IBC or BCH Codes examined by an expert agency annually and are records available?

The equipment should be inspected and tested by an expert at least once a year. (IBC 14.2.6)

Note: An 'expert' may be a member of the crew provided they have attended relevant courses and have documentation available to prove it.

8.87 Is the safety equipment inspected on board monthly and are records available?

The breathing apparatus should be inspected at least once a month by a responsible officer and the inspection recorded in the ship's log book. (IBC 14.2.6)

8.88 Are emergency escape sets provided for every person on board where required?

Ships intended for the carriage of certain cargoes identified by an 'E' in column 'n' of Chapter 17 should be provided with suitable respiratory and eye protection sufficient for every person on board for emergency escape purposes, subject to the following:

- Filter type respiratory protection is unacceptable;
- Self-contained breathing apparatus should have at least a duration of service of 15 minutes;
- Emergency escape respiratory protection should not be used for fire-fighting or cargo handling purposes and should be marked to that effect. (IBC 14.2.8)

8.89 Where filter-type respirators have been provided, is there an adequate system of control in place?

Notes: Where filter-type respirators are carried these are not to be considered as part of the safety equipment required by the Codes. Their use must be strictly supervised, they should be stored under the control of the chief officer and there should be clear labelling for which chemicals the canisters are approved for. There should be recognition that the lifetime of canisters is affected by the exposure and records should be maintained of use in order that this is not exceeded.

Filter-type respirators should not be used for chemicals identified as toxic by the Codes, nor should they be used in place of breathing apparatus.

8.90 Are decontamination showers and an eye-wash, where required, provided in suitably marked locations?

Suitably marked decontamination showers and an eyewash should be available on deck in convenient locations. The showers and eyewash should be operable in all ambient conditions. (IBC 14.2.10)

8.91 Is the type of foam compound suitable for the cargoes which the vessel is certified to carry?

Every ship should be provided with a fixed deck foam system. (IBC 11.3.1)

Only one type of foam concentrate should be supplied and it should be effective for the maximum possible number of cargoes intended to be carried. For other cargoes for which foam is not effective or is incompatible, additional arrangements to the satisfaction of the administration should be provided. Regular protein foam should not be used. (IBC 11.3.2)

Note: Ships constructed before 20th May 1981 may comply with the 1977 edition of the Code and therefore might have a dry powder instead of a foam system fitted.

Cargo hoses:

8.92 If the vessel uses its own cargo hoses are they in a satisfactory condition?

8.93 Are the hoses pressure tested annually to the design working pressure?

8.94 Is a record of all hose tests and inspections maintained on board?

Each hose should be stencilled or otherwise marked with the date of testing, its specified maximum working pressure and, if used in services other than the ambient temperature services, its maximum and minimum service temperature, as applicable. The specified maximum working pressure should be not less than 10 bar gauge. (IBC 2002 5.7)

Notes: This requirement applies to cargo hoses delivered after 1st July 2002.

Each hose should also be individually numbered for identification purposes.

Cargo lifting equipment:

8.95 Are all cargo derricks, cranes and other lifting equipment properly marked and has periodical testing and inspection been carried out?

Notes: Cargo lifting equipment should be load tested every five years and thoroughly examined by a competent person annually. Other lifting equipment is not regulated except as usually required by class, but should be tested and examined under a similar regime. The minimum SWL for which testing is required is one tonne (1,000 kgs).

A Chain Register is not required, but there must be documentation supporting test and examination.

8.96 Are winches associated with lifting equipment in a satisfactory condition?

Note: Cargo derrick topping lifts should have a means of securing them, such as a locking pin or ratchet, to prevent the weight of the derrick being solely taken by the winch brake. Check that this is fitted and that it and any associated winches are in good condition.

Additional comments:

If the Inspector has comments in respect of the subject matter covered by the Chapter additional to those which the Inspector may make in response to the specific key questions in the Chapter, the Inspector should include such additional comments in this section.

Chapter 8. Cargo and ballast systems – gas

Notes: This chapter can only be completed if the vessel is provided with a Certificate of Fitness for the carriage of gas. The vessel must be carrying gas at the time of the inspection; however a gas carrier which for a brief period is not actually carrying gas at the time of the inspection, may be inspected as a gas carrier provided that an adequate assessment of the procedures on board for the carriage of gas can be made. In such cases, the report must clearly note the circumstances.

In answering the questions below, note that:

- *The mandatory IGC Code applies only to those vessels the keel of which was laid on or after 1st July 1986;*
- *The mandatory GC Code applies to vessels delivered after 30th June 1980; and*
- *The non-mandatory EGC Code applies to those vessels delivered on or before the 31st October 1976.*

The IGC and GC Codes were amended during their lifetime and vessels built before those amendments came into force do not necessarily have to comply with those amendments.

Gas carriers that carry dual-code cargoes (Diethyl ether, Ethylene oxide/Propylene oxide mixtures with an E-o content of not more than 30%, Isoprene, Isopropylamine, Monoethylamine, Pentanes, Pentene, Propylene oxide, Vinyl ethyl ether and Vinylidene chloride) are additionally required to have a Noxious Liquid Substances Certificate. Gas carriers carrying oil cargoes, which are regulated under Annex 1, are required to hold an IOPP Certificate with a Form B which identifies the ship as a product carrier. The SOLAS Safety Construction and Safety Equipment Certificates should also identify the vessel as 'a tanker engaged in the trade of carrying oil other than crude oil'.

Relevant cargoes are those which do not contain heavy components likely to remain in the tanks after a ventilation procedure and will typically be Light naphtha, Jet fuel (also called Turbo fuel white or White cut gasoline), Mogas, Natural gasoline, Condensate, Pentane and Casing head gasoline.

Gas carriers accepted under this Notice of Equivalency will have:

- *Independent cargo tanks;*
- *An arrangement suitable for tank cleaning by ventilation procedures; tank cleaning with water will be prohibited as a normal procedure;*
- *Deep well pumps, but submerged electrical motors will not be accepted.*

Policies, procedures and documentation:

8.1 **Is the vessel provided with the operator's policy statements, instructions and procedures with regard to safe cargo operations?**

8.2 **Is information readily available on maximum loading rates?**

Note: The information should be displayed in the cargo control area.

8.3 **Is information on cargo loading limitations available?**

No cargo tanks should be more than 98% liquid full at the reference temperature. (IGC 15.1.1)

The administration may allow a higher filling limit than the limit of 98% at the reference temperature, taking into account the shape of the tank, arrangements of pressure relief valves, accuracy of level and temperature gauging and the difference between the loading temperature and the temperature corresponding to the vapour pressure of the cargo at the set pressure relief valves. (IGC 15.1.3)

The maximum allowable loading limits for each cargo tank should be indicated for each product which may be carried, for each loading temperature which may be applied and for the applicable maximum reference temperature, on a list to be approved by the administration. Pressures at which the relief valves, including those valves fitted in accordance with IGC 8.3, have been set should also be stated on the list. A copy of the list should be permanently kept on board by the master. (IGC 15.2)

Reference temperature means:

- *The temperature corresponding to the vapour pressure of the cargo at the set pressure of the pressure relief valves when no cargo vapour pressure/temperature control is provided;*
- *The temperature of the cargo upon termination loading, during transportation, or at unloading, whichever is the greatest, when a cargo vapour pressure/temperature control is provided. (IGC 15.1.4)*

Note: Although there are no regulatory requirements governing the maximum pressure below the relief valve setting which the cargo tanks should be allowed to reach, it is prudent to maintain the cargo tank pressure at or below 80% of the relief valve setting. During loading tanks may occasionally reach 90% of the relief valve setting.

8.4 Are legible and up to date pipeline and/or mimic diagrams of the cargo, inert gas and venting systems available in the cargo control area?

8.5 Is there a Procedures and Arrangements Manual available where dual code cargoes are carried?

Notes: A P and A Manual is required only if dual code cargoes are carried and where there is a NLS Certificate.

The form of the list in the P and A Manual is different to that attached to the Certificate of Fitness in that it contains information on miscibility (the percentage of the product which is soluble in water) and whether cargoes are suitable for cleaning by ventilation. That in the Certificate of Fitness contains the conditions of carriage.

8.6 Is the Cargo Record Book correctly completed and up to date?

A Cargo Record Book is required only for dual code cargoes and where there is a NLS Certificate.

Stability and cargo loading limitations:

The master of the ship should be supplied with a loading and stability information booklet. This booklet should contain details of typical service and ballast conditions, provisions for evaluating other conditions of loading and a summary of the ship's survival capabilities. In addition, the booklet should contain sufficient information to enable the master to load and operate the ship in a safe and seaworthy manner. (IGC 2.2.5)

8.7 Have stability calculations and, where applicable, stress calculations, been performed for the current cargo operation?

8.8 Is the stress and stability information included with the cargo plan and are any limitations understood by the cargo watch officers?

8.9 Are damage stability guidelines available?

The master of the ship should be supplied with a loading and stability information booklet. This booklet should contain details of typical service conditions, loading, unloading and ballasting operations, provisions for evaluating other conditions of loading and a summary of the ship's survival capabilities. In addition, the booklet should contain sufficient information to enable the master to load and operate the ship in a safe and seaworthy manner. (IGC 2.2.5)

8.10 Is the master aware of the worst damage stability condition in the stability book?

8.11 Is the vessel free of inherent intact stability problems?

Notes: Vessels which have large width tanks will be subject to reductions of intact stability due to free surface. Although such vessels may meet IMO intact stability criteria when in fully loaded or ballasted conditions, they may be unstable when multiple tanks are slack during cargo or ballast transfer operations, or in intermediate states of loading. Trim and stability manuals generally deal only with arrival and departure conditions and operators are not made aware that stability problems may exist at intermediate stages during cargo transfers.

If a vessel has either large width cargo tanks, U section ballast tanks, or double bottom tanks without watertight centreline bulkheads, attempt to ascertain if the vessel meets IMO intact stability criteria by requesting the chief officer to demonstrate, using the loading instrument, the intact stability of the worst case condition (all tanks slack and maximum free surface).

If there is no suitable loading instrument and adequate instructions are not available, the key question should be answered 'No', unless there is satisfactory proof that the vessel is free of inherent stability problems.

If cargo tanks are fitted with centre line bulkhead valves, these should normally be kept closed and only used for levelling. No more than 50% of the valves should be open at any one time.

8.12 If a loading computer or programme is in use, is it class approved?

If a class approved loading computer is not available, record as to how stress and stability calculations are performed.

Notes: Class requirements are that ships of more than 65 metres in length shall be provided with an approved type loading instrument. Ships with very limited possibilities for variations in the distribution of cargo and ballast and ships with a regular or fixed trading pattern may be exempt from the requirement.

90

The loading instrument is to be capable of calculating shear forces and bending moments, in any load or ballast condition at specified readout points and is to indicate the permissible values.

8.13 Are there records indicating that the operational accuracy of the load computer is tested regularly?

Note: Class approved data should be used and the tests should be carried out at least quarterly.

8.14 Are longitudinal stresses, where applicable, maintained within design limits throughout?

8.15 Are cargo and/or ballast tanks free of sloshing or weight restrictions?

Record any important restrictions, other than those normally applied such as maximum density.

8.16 Where applicable, are officers aware of the dangers of high free surface effects and of the possibility of structural damage caused by sloshing in cargo tanks?

8.17 Do the operator's operating manuals include procedures for restoring stability in case of unstable conditions developing during cargo operations, where applicable?

Note: On refrigerated LPG vessels fitted with centre line bulkheads having level gauges fitted close to the bulkhead on either side, the level gauges will indicate substantially differing liquid levels if the vessel is listed, even though both sides of the tank may contain approximately equal quantities. Personnel must be aware of this when taking actions to correct a list.

Cargo operations and related safety management:

8.18 If the cargoes being carried were not listed on the Certificate of Fitness, on whose authority were the cargoes loaded?

Note: If the cargo being carried is not listed on the Certificate of Fitness, there must be authorisation from the administration allowing the product to be carried.

8.19 Are all officers familiar with the cargo system?

8.20 Are all officers familiar with the carriage requirements for the cargoes on board?

Note: Officers should be able to demonstrate a basic knowledge of the following:

- *Shipboard operations and cargo handling;*
- *The IGC, GC and EGC Codes, where applicable;*
- *SIGTTO and ICS Guides;*
- *Cargo reliquefaction procedures;*
- *Cargo tank environmental control procedures when gas freeing and gassing up;*
- *Hazards associated with thermal loads, particularly when cooling down;*
- *The minimum cargo temperature;*
- *Requirements for medical treatment following exposure to hazardous cargoes;*
- *Spill response;*
- *Communication procedures with shore;*
- *Emergency stop procedures, including which systems are affected by ESD activation.*

And, as required:

- *The meaning of Category A, B, C and D cargoes;*
- *Precautions for reactive and self-reactive cargoes;*
- *Limitations when loading high density cargoes;*
- *Effects of sloshing loads;*
- *Hazards associated with toxic cargoes.*

8.21 Is the chief officer familiar with the term 'reference temperature' and has it been determined for this cargo?

Reference temperature means:

- *The temperature corresponding to the vapour pressure of the cargo at the set pressure of the pressure relief valves when no cargo vapour pressure/temperature control is provided;*
- *The temperature of the cargo upon termination loading, during transportation, or at unloading, whichever is the greatest, when a cargo vapour pressure/temperature control is provided.*

(IGC 15.1.4)

8.22 When an unfamiliar gas cargo is to be carried, is there a procedure to review the safety aspects and handling procedures?

Note: For each gas carried a review of the carriage requirements should have been made in order to ensure that the cargo plan contains all the necessary information for the safe carriage of the product. The review should reference:

- *The IGC Code Chapter 19;*
- *The Certificate of Fitness;*
- *The P and A Manual; and*
- *Material Safety Data Sheets.*

8.23 Is a cargo compatibility chart available?

Note: Data sheets and compatibility charts can be found in the SIGTTO and ICS guides. For example, pages 21 to 23 of 'Liquefied Gas Handling Principles'. Charterer's instructions should be followed.

8.24 Has a cargo handling plan been prepared which provides a detailed sequence of cargo and ballast transfer?

Note: The plan should cover all stages of the transfer operations, namely:

- *Quantity and grade of each parcel;*
- *Density, temperature and other relevant conditions, including the reference temperature which determines the filling limits;*
- *A plan of the distribution, quantities, innages, lines and pumps to be used;*
- *Transfer rates and maximum allowable pressures;*
- *Critical stages of the operation;*
- *Notice of rate change;*
- *Stability and stress information;*
- *Drafts and trims;*
- *Emergency stop procedures;*
- *Action to be taken in the event of a spill;*
- *Flammability and toxicity with references to cargo data sheets;*
- *Ballast operations;*
- *Protective equipment requirements;*
- *Hazards of the particular cargoes.*

And, as required, requirements for:

- *Cargo pollution category;*
- *Cooling requirements including rates of cool-down;*
- *Use of the cargo heater or vapouriser;*
- *Heel requirements after discharge;*
- *Under keel clearance limitations;*
- *Bunkering; and*
- *Special precautions required for the particular operation.*

8.25 Has the plan been signed by the watch officers to indicate their understanding of it?

8.26 Are cargo operations being carried out and logged in accordance with the plan?

8.27 If the cargo is required to be inhibited, is the required information available?

Care should be taken to ensure that the cargo is sufficiently inhibited to prevent polymerisation at all times during the voyage. Ships should be provided with a certificate from the manufacturer stating:

- *Name and amount of inhibitor added;*
- *Date inhibitor was added and the normally expected duration of its effectiveness;*
- *Any temperature limitations affecting the inhibitor;*
- *The action to be taken should the length of the voyage exceed the effective lifetime of the inhibitors.* (IGC 17.8)

Vinyl chloride may be inhibited. The control of the oxygen content in the vapour space whether inhibited or not is important. (IGC 17.21)

Note: The products which are required to be inhibited are identified in column 'I' of Chapter 19. They are Butadiene, Isoprene, Vinyl ethyl ether and Vinylidene chloride. Products required to be inhibited should be refused if an inhibitor certificate is not available.

- 8.28 Are Material Safety Data Sheets (MSDS) on board for all the products being handled and are all officers familiar with their use?

Note: An MSDS should be posted for each product the vessel is carrying.

- 8.29 Are all officers aware of the emergency procedures for dealing with leakage, spillage or fire involving the cargo?

Officers should be trained in emergency procedures to deal with conditions of leakage, spillage or fire involving the cargo and a sufficient number of them should be instructed and trained in essential first aid for the cargoes carried. (IGC 18.3.3)

- 8.30 Do officers understand the principles involved when cargo and booster pumps and cargo heaters, where fitted, are lined up in series?

Note: The officers responsible should understand the higher manifold pressures involved when operating deepwell pumps in series with booster pumps. The pumps usually have significantly different capacities and the total flow may have to be regulated on the booster pump outlet to prevent this pump from running dry. The cargo heater, if used, will increase the line pressure even further. The responsible officers should have a good working knowledge of the safety systems installed to protect the heater - for example to prevent freezing and tube failure when sea-water is the heating medium. The total outlet pressure from the deepwell/booster/heater unit may exceed the rating of normal refrigerated lines and a special heater crossover may be required for this purpose.

- 8.31 Are submerged electrical cargo pumps, where fitted, isolated from their electrical supply during gas-freeing operations?

Notes: Submerged electric pumps should not be used for oil products.

The junction boxes of submerged electric pumps should be visually inspected prior to each discharge and the insulation reading taken and recorded.

- 8.32 Is the verbal communication between the ship and the shore adequate?

- 8.33 If refrigerated cargoes are carried, is a means of hydrate control provided and is a supply of freezing depressant maintained onboard?

Notes: LPG cargoes may be dosed with a freezing depressant such as methanol or ethanol under instructions from the shipper. Use of methanol must not be made in chemical gas cargoes (Diethyl ether, Ethylene oxide/Propylene oxide mixtures with an E-o content of not more than 30%, Isoprene, Isopropylamine, Monoethylamine, Pentanes, Pentene, Propylene oxide, Vinyl ethyl ether and Vinylidene chloride).

Because of the sensitivity of many cargoes to hydrate control products, the use of hydrate control must be strictly in accordance with the instructions of the shipper/charterer. There may be alternative ways of providing hydrate control other than by the use of anti-freeze compounds.

Carriage of methanol is prohibited by some administrations. In the case of ethylene and LNG, in addition to causing contamination, methanol cannot be used as it freezes at -87°C .

Cargo handling and monitoring equipment:

- 8.34 Are the following, where fitted, in good order and is there evidence of regular testing?

Cargo, booster, ballast and stripping pumps, eductors and their associated instrumentation and controls;	<i>Note: Instrumentation, valves and pipework should be clearly marked to indicate their service and where applicable the compartment to which they relate.</i>
Cargo heater and/or vapouriser;	<i>Note: The number of plugged tubes in cargo condensers, heaters or vapourisers should not exceed 25%.</i>
Cargo, vapour and inert gas lines;	
Cargo pump emergency shut down system;	<i>Pump alarms and trips, level alarms, etc., where fitted, should be tested regularly to ensure that they are functioning correctly, and the results of these tests should be recorded.</i>
Cargo and ballast system valves;	

Cargo system innage gauges;	
Remote and local temperature and pressure sensors and gauges;	<p><i>Each cargo tank should be provided with at least two devices for indicating cargo temperatures, one placed at the bottom of the cargo tank and the second near the top of the tank below the highest allowable liquid level. The temperature indicating devices should be marked to show the lowest temperature for which the cargo tank has been approved by the administration. (IBC 13.5.1)</i></p> <p><i>The vapour space of each cargo tank should be provided with a pressure gauge which should incorporate an indicator in the cargo control position. (IBC 13.4.1)</i></p>
Cargo tank high level and overflow alarms.	

8.35 Are deep well cargo pump and booster pump mechanical seals free of oil leaks?

8.36 Is an emergency discharge method available?

Where cargo transfer is by means of cargo pumps not accessible for repair with the tanks in service, at least two separate means should be provided to transfer cargo from each cargo tank and the design should be such that failure of one cargo pump, or means of transfer, will not prevent the cargo transfer by another pump or pumps, or other cargo transfer means. (IGC 5.8.1)

Gas pressurisation may be accepted as a means of transfer of cargo for those tanks so designed that the design factor of safety is not reduced under the conditions prevailing during the cargo transfer operation. (IGC 5.8.2)

8.37 Are tank domes and associated fittings in a satisfactory condition and free from corrosion?

8.38 Is the cargo system, including fittings on the tank domes, free of leaks?

8.39 Are sample lines provided for both liquid and vapour and are they valved and capped?

8.40 Is low temperature pipework adequately insulated from the hull structure?

Low temperature piping should be thermally isolated from the adjacent hull structure, where necessary, to prevent the temperature of the hull from falling below the design temperature of the hull material. (IBC 5.2.1.3)

8.41 If any cargo or vapour lines are insulated, is the insulation in a satisfactory condition?

Notes: Liquid and vapour lines are not required to be insulated. However, if insulation is fitted, a programme to regularly check and record its condition should be in place. Ascertain the condition of the cargo and vapour lines underneath if possible.

Comment if there is any evidence of corrosion.

Evidence of local repairs to the insulation might be an indication of repairs to the cargo or vapour lines underneath having been carried out.

8.42 Where cargo or vapour lines are isolated from the structure, are joints electrically bonded?

Where tanks or piping are separated from the ship's structure by thermal isolation, provision should be made for electrically bonding both the piping and the tanks. All gasketed pipe joints and hose connections should be electrically bonded. (IGC 5.2.1.4)

Note: Some gaskets are electrically conductive and bonding is not required.

8.43 Are cargo and vapour line expansion arrangements in a satisfactory condition?

Provision should be made by the use of offsets, loops, bends, mechanical expansion joints such as bellows, slip joints and ball joints or similar suitable means to protect the piping system components and cargo tanks from excessive stresses due to thermal movement and from movements of the tank and hull structure. Where mechanical expansion joints are used in piping they should be held to a minimum and, where located outside cargo tanks, should be of the bellows type. (IGC 5.2.1.2)

Slip joints should not be used except within the cargo tanks. (IGC 5.4.5.2)

Note: Some bellows pieces may be fitted with covers to protect against the ingress of water. This design feature is acceptable.

8.44 Are liquid and vapour lines free to move inside their clamps?

8.45 Are pipeline drains and stub pieces valved and capped and in a satisfactory condition?

8.46 Are cargo line and system relief valves in a satisfactory condition?

All pipelines or components which may be isolated in a liquid-full condition should be provided with relief valves. (IBC 5.2.1.6)

Relief valves discharging liquid cargo from the cargo piping system should discharge into the cargo tanks; alternatively they may discharge to the cargo vent mast if means are provided to detect and dispose of liquid cargo which may flow into the vent system. Relief valves on cargo pumps should discharge to the pump suction. (IBC 5.2.1.7)

8.47 Are cargo pipelines free of screwed-in connections?

Screwed couplings acceptable to the administration should only be used for accessory lines and instrumentation lines with external diameters of 25 mm or less. (IBC 5.4.2.3)

8.48 Is the cargo tank high level alarm system independent of both the gauging devices and the overflow-control alarm system?

Each tank should be fitted with a high liquid level alarm operating independently of other liquid level indicators and giving an audible and visual warning when the activated. Another sensor operating independently of the high liquid level alarm should automatically actuate a shutoff valve in a manner which both avoids excessive liquid pressure in the loading line and prevents the tank from becoming liquid full. (IGC 13.3.1)

Neither of these devices is required if the cargo tank:

- Is a pressure tank with a volume of not more than 200 m³;*
- Is designed to withstand the maximum possible pressure during the loading operation and such pressure is below that of the start-to-discharge pressure of the cargo tank relief valve. (IGC 13.3.2)*

Note: The overflow-control alarm system does not have to be independent of the gauging system.

8.49 Are there records of the calibration of key cargo instrumentation, including temperature and pressure gauges?

Notes: There should be records of the regular checking and calibration of instrumentation, particularly cargo tank temperature and pressure gauges and reliquefaction plant instruments. Calibration should be carried out preferably at intervals not exceeding 30 months.

Calibration of instrumentation is often difficult whilst the vessel is in service and it is usually carried out during repair periods. However, comparisons between local and remote thermometer readings and cross checking with cargo vapour pressure (from tables) provide a practical cross-reference, particularly for high purity cargoes such as Polymer Grade Propylene.

8.50 If slip tubes are fitted, are they for use only in emergencies?

If slip tubes are the only method of gauging, record the fact as an observation.

Note: Slip tubes are generally used only in cases of emergency. A small amount of cargo vapour or liquid is released during level measurement; therefore they are a restricted type of gauging device and must not be used when toxic cargoes are carried and in the case of flammable cargoes, only if permitted by the terminal and the charterer.

8.51 Is the high level alarm system operated during both loading and discharging operations?

8.52 Are the cargo tank high level alarms independent of the gauging system and in the case of IGC vessels, also independent of the high level shut-down (overflow control) system?

Except as detailed below, each cargo tank should be fitted with a high liquid level alarm operating independently of other liquid level indicators and giving an audible and visual warning when activated.

Either this sensor (GC vessels) or another sensor operating independently of the high liquid level alarm (IGC vessels) should automatically actuate a shutoff valve (which might be either the ESD or the cargo tank filling valve) in a manner which will both avoid excessive liquid pressure in the loading line and prevent the tank from becoming liquid full. (IGC 13.3.1)

- 8.53 If the high level and/or shut-down systems can be overridden by a key switch, is there a written procedure detailing under what circumstances and by whom the system may be overridden?

Notes: The system should only be overridden in exceptional circumstances, such as if the tank has been overfilled and it is necessary to by-pass the overflow control system to discharge the tank.

Such systems are occasionally over-ridden at sea during reliquefaction.

- 8.54 Is the cargo tank heating system, where fitted, satisfactory?

Cargo compressor and motor rooms:

- 8.55 Is the cargo conditioning (reliquefaction) plant and associated machinery and instrumentation in good order?

Note: Records should be available of the pressure testing of cargo condensers and of the calibration of cargo system instrumentation.

- 8.56 Are the compressor and motor rooms clean and free of combustible material?

- 8.57 Are the bulkhead seals between the compressor room and the motor room gas tight and well lubricated?

Where pumps and compressors are driven by a shaft passing through a bulkhead or deck, gastight seals with efficient lubrication or other means of ensuring the permanence of the gas seal should be fitted in way of the bulkhead or deck. (IGC 3.3.2)

Note: Lubricator reservoirs, where fitted, should be checked to ensure they contain sufficient oil.

- 8.58 Is the compressor room free of gas leaks?

- 8.59 Is the compressor room well lit and are electrical fittings suitable for use in gas-hazardous areas and in a satisfactory condition?

- 8.60 Is the compressor room ventilation system maintaining negative pressure?

- 8.61 Is the motor room ventilation system maintaining positive pressure and operating satisfactorily?

- 8.62 If the motor room access is located in a gas-hazardous area, is it provided with an air-lock suitably alarmed to warn of both doors being opened at the same time?

- 8.63 Are airlocks and alarms in good order?

Access from the open weather deck to gas-safe spaces should be located in a gas-safe zone at least 2.4 metres above the weather deck unless the access is by means of an airlock. (IBC 3.5.4)

- 8.64 If pressure in the air-lock is lost, will the shutdown system operate correctly?

- 8.65 Is the gas detection equipment in a satisfactory condition?

A permanently installed system of gas detection and audible and visual alarms should be provided for:

- *Cargo compressor rooms;*
- *Motor rooms for cargo handling machinery;*
- *Cargo control rooms unless designated gas-safe;*
- *Other enclosed spaces in the cargo area where vapour may accumulate including hold spaces and interbarrier spaces for independent tanks other than type C;*
- *Ventilation hoods and gas ducts where required by Chapter 16 for LNG carriers; and*
- *Airlocks. (IGC 13.6.7)*

The gas detection system should be capable of sampling and analysing for each sampling head sequentially at intervals not exceeding 30 minutes. (IGC 13.6.8)

- 8.66 Are fixed gas detector sample points fitted at the appropriate level for the cargo being carried?
In every installation the positions of fixed sampling heads should be determined with due regard to the density of the vapours of the products intended to be carried and the dilution from compartment purging or ventilation. (IGC 13.6.2)

Note: Where it is possible to manually choose whether upper or lower level sampling heads should be in use, lower level sampling heads should be in use for all cargoes except Ammonia and LNG.

8.67 Are cargo compressors isolated from the cargo when carrying Propylene Oxide?

Note: There should be approved procedures for the carriage of PO, including the blanking or removal of spool pieces between the cargo compressors and the cargo containment.

Void spaces and seals - type C cargo tanks:

Note: This section applies to Type C cargo tanks which do not require secondary barriers.

8.68 Are void space seals, where fitted, in a satisfactory condition?

8.69 Is the environmental control of void spaces satisfactory?

Spaces surrounding Type C refrigerated cargo tanks not having secondary barriers should be filled with suitable inert gas or dry air and be maintained in this condition with make up inert gas provided by a shipboard inert gas generation system, shipboard storage of inert gas, or dry air provided by suitable drying equipment. (IGC 9.3)

8.70 Is cargo tank insulation, where fitted, reported to be in good condition?

Where a product is carried at a temperature below -10°C suitable insulation should be provided to ensure that the temperature of the hull structure does not fall below the minimum allowable design temperature. (IBC 4.8.1)

Note: Check hold space inspection records. If perlite insulation is used, establish that it is regularly checked and topped up as required.

8.71 Are relief valves for void spaces, where fitted, in good order?

Void and interbarrier spaces and seals – other cargo tank types:

Note: This section should be completed for all types of cargo containment other than Type C cargo tanks. These include integral, membrane, semi-membrane and independent Type A and B cargo tanks.

For cargo containment systems other than Type C:

- Interbarrier and hold spaces associated with cargo containment systems for flammable gas requiring full secondary barriers should be inerted with a suitable dry inert gas and kept inerted with make-up gas provided by a shipboard inert gas generation system, or by shipboard storage which should be sufficient for normal consumption for at least 30 days. (IGC 9.2.1)*
- Interbarrier and hold spaces associated with cargo containment systems for flammable gases requiring partial secondary barriers should be inerted with a suitable dry inert gas and kept inerted with make-up gas provided by a shipboard inert gas generation system, or by shipboard storage which should be sufficient for normal consumption for at least 30 days. (IGC 9.2.2.1)*

8.72 Is the oxygen and hydrocarbon content of the interbarrier spaces regularly monitored and the results recorded?

...hold spaces and interbarrier spaces should be provided with a permanently installed gas detection system capable of measuring gas concentrations of 0%-100% by volume. Alarms should be actuated when the vapour concentration reaches the equivalent of 30% of the LEL in air or such other limit as may be approved by the administration. (IGC 13.6.11)

Notes: 30% LEL is the equivalent of 1.5% by volume.

Record whether a log of gas readings is being maintained.

Records should be kept to demonstrate the levels and any apparent trends or changes in level.

8.73 Is the interbarrier space nitrogen purging system in good order?

Note: Review records of nitrogen consumption and running hours of nitrogen generator to confirm the efficiency of the interbarrier space. Frequent sweeping or purging with nitrogen, with resultant use of nitrogen, is used to reduce the explosive gas levels.

8.74 Is the pressure in the interbarrier spaces being maintained at a sufficient level to prevent ingress from the atmosphere?

The secondary barrier should be capable of being periodically checked for its effectiveness, by means of a pressure/vacuum test, a visual inspection, or another suitable method acceptable to the administration.

Note: The interbarrier spaces should be being maintained at positive pressure and records of the pressure should be being maintained.

8.75 Are the relief valves for the hold spaces and primary and secondary barriers in good order?

Hold spaces and interbarrier spaces which may be subject to pressures beyond their design capabilities should be provided with a pressure relief system. (IGC 8.1)

Interbarrier spaces should be fitted with pressure relief devices to the satisfaction of the administration.

Note: Hold spaces without open connection to the atmosphere should be provided with suitable pressure gauges.

8.76 Is cargo tank insulation, where fitted, reported to be in a satisfactory condition?

Where a product is carried at a temperature below -10°C suitable insulation should be provided to ensure that the temperature of the hull structure does not fall below the minimum allowable design temperature.

Notes: Check hold space inspection records. If perlite insulation is used, establish that it is regularly checked and topped up as required.

8.77 Is there a means to sample for ingress of water into the interbarrier spaces provided and are checks being recorded?

Note: There should be a means available to drain the interbarrier spaces.

8.78 Is the glycol heating system in the void spaces between cargo tanks, where fitted, in good order?

Inert gas systems:

8.79 Is the inert gas system and/or storage and associated pipework, where fitted, in good order?

8.80 Are suitable arrangements provided to prevent the backflow of cargo vapour into the inert gas system?

Arrangements suitable for the cargo carried should be provided to prevent the backflow of cargo vapour into the inert gas system. (IGC 9.4.4)

A means acceptable to the administration, located in the cargo area, of preventing the backflow of cargo gas should be provided. (IGC 9.5.2)

Note: Protection against back-flow of gas is usually made by providing two non-return valves and a spool piece. Check that except when inert gas is being delivered, the spool piece is not in place and that officers clearly understand this important requirement.

Pressure relief and venting systems:

8.81 Have the safety relief valves been tested, are the test certificates onboard and are officers aware of their settings?

Pressure relief valves should be set and sealed by a competent authority acceptable to the administration and a record of this action, including the values of set pressure, should be retained on board the ship.

In the case of cargo tanks permitted to have more than one relief valve setting this may be accomplished by:

- *Installing two or more properly set and sealed valves and providing means as necessary for isolating the valves not in use from the cargo tank; or*
- *Installing relief valves whose settings may be changed by the insertion of previously approved spacer pieces or alternative springs or by other similar means not requiring pressure testing to verify the new set pressure. All other valve adjustments should be sealed*

Ascertain that the officers responsible clearly understand the procedures to be followed for changing settings.

8.82 Are there adequate procedures for the changing of the relief valve set pressure?

The changing of the set pressure should be carried out under the supervision of the master in accordance with procedures approved by the administration and specified in the ship's operating manual. (IGC 8.2.7)

Note: Terminal requirements must also be taken into account when settings are changed. Ascertain that the pressure settings in use are correct for the cargoes on board.

- 8.83 If the cargo tank safety relief valve settings can be altered, are the appropriate settings being used for the cargo carried and are the current settings prominently displayed in the cargo control position and at the valves?**

Changes in set pressures should be recorded in the ship's log and a sign posted in the cargo control room, if provided and at each relief valve, stating the set pressure. (IGC 8.2.7)

- 8.84 Is the cargo vent system in a satisfactory condition?**

- 8.85 Are vent outlet protective or flame screens fitted as required and are there records of their regular inspection?**

Suitable protection screens should be fitted on vent outlets to prevent the ingress of foreign objects.

(IBC 8.2.14)

Cargo tank outlets should be provided with readily renewable and effective flame screens or safety heads of an approved type when carrying a cargo referenced in column 'i' of Chapter 19 - (Diethyl ether, Ethylene oxide-Propylene oxide mixtures with an E-o content of not more than 30%, Isoprene, Isopropylamine, Monoethylamine, Pentanes, Pentene, Propylene oxide, Vinyl ethyl ether and Vinylidene chloride). Due attention should be paid in the design of flame screens and vent heads to the possibility of the blockage of these devices by the freezing of cargo vapour or by icing up in adverse weather conditions. Ordinary protection screens should be fitted after the removal of flame screens. (IGC 17.10)

- 8.86 Is there a liquid sensor in the liquid pressure relief valve collecting tank or, if not fitted, in the vent mast?**

In the vent piping system, means for draining liquid from places where it may accumulate should be provided. The pressure relief valves and piping should be so arranged that liquid can under no circumstances accumulate in or near the pressure relief valves. (IGC 8.2.13)

Relief valves discharging liquid cargo from the cargo piping system should discharge into the cargo tanks. Alternatively they may discharge to the cargo vent mast if means are provided to detect and dispose of any liquid cargo which may flow into the vent system. (IGC 5.2.1.7)

- 8.87 Are the nitrogen snuffers on the vent masts, where fitted, in a satisfactory condition?**

Emergency shut down system:

- 8.88 Is the emergency shut down (ESD) system in good order?**

One or more remotely controlled emergency shutdown valves should be provided on the ship for shutting down liquid and vapour cargo transfer between ship and shore. (IGC 5.6.1.1)

One remotely operated emergency shutdown valve should be provided at each cargo hose connection in use. (IGC 5.6.3)

- 8.89 Are personnel aware of the requirements for the ESD system?**

Cargo pumps and compressors should be arranged to shutdown automatically if the emergency shutdown valves required by 5.6.1.1 (above) are closed by the emergency shutdown system. (IGC 5.6.1.3)

- 8.90 Are there at least two remote positions where the ESD system can be manually activated?**

The control system for all required emergency shutdown valves should be so arranged that all such valves may be operated by single controls situated in at least two remote locations on the ship. One of these locations should be in the control position or cargo control room. (IGC 5.6.4)

- 8.91 Is the ESD system designed to fail-closed?**

Emergency shut-down valves should be of the fail-closed (closed on loss of power) type and be capable of local manual closing operation. (IGC 5.6.4)

- 8.92 Is the ESD system tested prior to cargo transfer and are records maintained?**

8.93 Are all manifold valves and tank filling valves, if they form part of the emergency shutdown system, tested and timed to close within 30 seconds?

Emergency shutdown valves in liquid piping should fully close under all service conditions within 30 seconds of actuation. Information about the closing time of the valves and their operating characteristics should be available onboard and the closing time should be verifiable and reproducible. Such valves should close smoothly. (IGC 5.6.4)

Cargo pumps and compressors should be arranged to shutdown automatically if the emergency shutdown valves are closed by the emergency shutdown system. (IGC 5.6.1.3)

Notes: The emergency shutdown valve at the manifold may be located either inside or outside the hand operated manifold valve.

If cargo tank valves are not part of the ESD their closing times are not controlled by the requirements of the ESD.

8.94 Are fusible plugs fitted on the liquid domes and in the vicinity of the manifolds and are they in a satisfactory condition?

The control system should also be provided with fusible elements designed to melt at temperatures between 98° and 104° C which will cause the emergency shutdown valves to close. Locations for such fusible elements should include the tank domes and loading stations. (IGC 5.6.4)

Note: Fusible elements should not be painted over as this might affect the temperature at which they will operate.

Manifold arrangements:

8.95 Are cargo and vapour manifold arrangements satisfactory?

8.96 Is the manifold area clear of obstructions which could interfere with the automatic release of a hard arm?

8.97 Does the manifold arrangement provide for safe access for connection and disconnection of cargo lines?

8.98 Are manifold pressure gauges fitted outboard of the manifold valves and are they in good order?

8.99 Are pressure gauges also fitted to the offshore manifolds and regularly checked during the discharge for manifold valve leakage?

8.100 Are manifold pressure gauges fitted with valves or cocks?

8.101 Are all flange connections fully bolted?

Note: This includes any line which is being used for, or might become pressurised during, cargo operations on both sides of the vessel.

8.102 Are manifold blank flanges of an equivalent rating to that of the manifold pipelines?

Notes: It is generally accepted that steel blanks should be of the same thickness as the flanges to which they are attached, but this will not necessarily result in the pressure capability being the same as that of the associated pipework.

It is the pressure rating of the blank which is important and blanks made of materials such as titanium have a superior strength and may therefore be significantly thinner for the same pressure rating as a mild steel blank. If such a blank is fitted, there must be documentation on board to prove that the pressure rating is adequate for the service.

8.103 Are the manifold valves and lines clearly marked as to whether they are liquid or vapour?

8.104 Are the manifolds fitted with drain lines and purge points and are they valved and capped?

8.105 Is a temperature gauge fitted at the manifold?

8.106 Are manifold strainers, where fitted, not being by-passed?

8.107 Are liquid spill arrangements adequate, taking into account the lowest temperature cargoes which the vessel is certified to carry?

Where leakage may be anticipated, such as at shore connections and at pump seals, protection for the hull beneath should be provided. (IGC 5.2.1.3)

Safety equipment:

8.108 Is suitable protective equipment available for all crew members engaged in cargo operations?

Suitable protective equipment including eye protection should be provided for protection of crew members engaged in loading and discharging operations, taking into account the character of the products. (IGC 14.1)

8.109 Are there at least two complete sets of safety equipment on board and are they in a satisfactory condition?

Sufficient, but not less than two complete sets of safety equipment in addition to the firemen's outfits, each permitting personnel to enter and work in a gas-filled space, should be provided.

One complete set of safety equipment should consist of:

- *One self contained air-breathing apparatus having a capacity of at least 1,200 litres of free air;*
- *Protective clothing, boots, gloves and tight-fitting goggles;*
- *Steel-cored rescue line with belt; and*
- *Explosion proof lamp. (IGC 14.2.2)*

An adequate supply of compressed air should be provided and should consist either of:

- *One set of fully charged spare air cylinders for each breathing apparatus;*
- *A special air compressor suitable for the supply of high-pressure air of the required purity; and*
- *A charging manifold capable of dealing with sufficient spare breathing apparatus air cylinders for the breathing apparatus; or*
- *Fully charged spare air cylinders with a total free air capacity of at least 6,000 litres for each breathing apparatus. (IGC 14.2.3)*

Note: For vessels carrying Ammonia and other toxic cargoes, the safety equipment referred to above should provide full protection. The suits themselves should be capable of providing adequate protection against the product and they should be fitted with integral gloves and boots. Such suits are not required if the vessel does not carry toxic cargoes.

8.110 If the vessel has a cargo capacity greater than 5,000 m³, is the additional firemen's outfit carried?

Every ship carrying flammable products should carry firemen's outfits complying with SOLAS as follows:

- *5,000 m³ and below: 4 outfits;*
- *Above 5,000 m³: 5 outfits. (IGC 11.6.1)*

8.111 Is the safety equipment correctly located?

The protective equipment and safety equipment should be kept in suitable, clearly marked lockers located in readily accessible places. (IGC 14.2.5)

8.112 Where required in vessels of a cargo capacity of 2,000 m³ and over, are the two additional sets of safety equipment on board?

Where required by the note 14.4.4 in column 'h' of Chapter 19, (Acetaldehyde, Ammonia, Chlorine, Dimethylamine, Ethylene oxide, Methyl bromide, Monoethylamine, Pentanes, Pentene and Sulphur dioxide), two complete sets of safety equipment should be provided in addition to the equipment required above. At least three spare charged air cylinders should be provided for each self-contained air breathing apparatus. (IGC 14.4.4)

8.113 Where required are emergency escape sets provided for all personnel, plus two sets in the wheelhouse?

Where required by the note 14.4.2 in column 'h' of Chapter 19, (Ammonia, Chlorine, Diethyl ether, Dimethylamine, Ethylene oxide, Isopropylamine, Methyl bromide, Monoethylamine, Sulphur dioxide, Vinyl chloride, Vinyl ethyl ether and Vinylidene chloride), respiratory and eye protection suitable for emergency escape purposes should be provided for every person on board subject to the following:

- *Filter-type respiratory protection is unacceptable;*

- *Self-contained breathing apparatus should normally have a duration of service of at least 15 minutes;*
- *Emergency escape respiratory protection equipment should not be used for fire-fighting or cargo handling purposes and should be marked to that effect;*
- *Two additional sets of the above respiratory and eye protection should be permanently located in the navigating bridge.* (IGC 14.4.2)

8.114 Is the safety equipment required by the IGC Code examined by an expert annually and are records available?

The compressed air equipment should be inspected at least once a month by a responsible officer and the inspection recorded in the ship's log book and inspected and tested by an expert at least once a year. (IGC 14.2.6)

Note: An 'expert' may be a member of the crew provided they have attended relevant courses and have documentation available to prove it.

8.115 Is the safety equipment inspected on board monthly and are records available?

The compressed air equipment should be inspected at least once a month by a responsible officer and the inspection recorded in the ship's log book. (IGC 14.2.6)

8.116 Are decontamination showers and an eye-wash, where required, provided in suitably marked locations?

Suitably marked decontamination showers and an eyewash should be available on deck in convenient locations. The showers and eyewash should be operable in all ambient conditions. (IGC 14.4.3)

Notes: This requirement is only for vessels certified for the carriage of cargoes listed in column 'i' of the table in Chapter 19.

These cargoes are Acetaldehyde, Ammonia, Chlorine, Diethyl ether, Dimethylamine, Ethylene oxide, Ethylene oxide/Propylene oxide mixtures with an E-o content of not more than 30%, Isoprene, Isopropylamine, Methyl bromide, Monoethylamine, Propylene oxide, Vinyl chloride, Vinyl ethyl ether and Vinylidene chloride.

8.117 Is the chemical dry powder system in good order?

Ships in which the carriage of flammable products is intended should be fitted with fixed dry chemical powder type extinguishing systems for the purpose of fighting fire on the deck in the cargo area and bow or stern cargo handling areas if applicable. (IGC 11.4.1)

Notes: Records should be maintained of the dates when the powder in the system cylinders was last agitated and of powder discharge. Powder should be agitated, or fluffed, regularly to prevent compaction.

A check should be made as to the type of bolts used in the system. Stainless steel bolts under stress and exposed to salt water are subject to corrosion and fatigue cracking. Mild steel bolts therefore should be used.

8.118 Is the water spray system in good order?

On ships carrying flammable or toxic products or both, a water-spray system for cooling, fire prevention and crew protection should be installed to cover:

- *Exposed cargo tank domes and any exposed parts of cargo tanks;*
- *Exposed on-deck storage vessels for flammable or toxic products;*
- *Cargo liquid and vapour discharge and loading manifolds and the area of their control valves and any other areas where essential control valves are situated and which should be at least equal to the area of the drip trays; and*
- *Boundaries of superstructures and deckhouses normally manned, cargo compressor rooms, cargo pump rooms, store rooms containing high fire risk items and cargo control rooms, all facing the cargo area. Boundaries of unmanned forecastle structures not containing high fire risk items or equipment do not require water spray protection.* (IGC 11.3.1)

Note: The piping system may be constructed from stainless steel or of mild steel and may be lined with PVC. If mild steel is used, then the system should be drained and dried to avoid the formation of rust particles inside mild steel pipe that may block the nozzles.

8.119 Are the cargo space smothering systems in good order?

An appropriate fire fighting system approved by the administration should protect these spaces in ships dedicated to the carriage of a restricted number of cargoes. (IGC 11.5)

Notes: The IGC Code requires cargo compressor rooms to be provided with a carbon dioxide extinguishing system.

Under the GC Code, the spaces should be provided with a fixed installation which is capable of extinguishing a fire within the space.

Cargo hoses:

8.120 If the vessel uses its own cargo hoses are they in a satisfactory condition?

8.121 Are the hoses pressure tested annually to the design working pressure?

8.122 Is a record of all hose tests and inspections maintained on board?

Each hose should be stencilled or otherwise marked with its specified maximum working pressure and, if used in other than the ambient temperature services, its maximum or minimum service temperature, or both. The specified maximum working pressure should be not less than 10 bar gauge. (IGC 5.7.3)

Notes: This requirement applies to cargo hoses delivered after 1st July 2002.

Each hose should also be marked with the test date and be individually numbered for identification purposes.

Cargo lifting equipment:

8.123 Are all cargo derricks, cranes and other lifting equipment properly marked and has periodical testing and inspection been carried out?

Notes: Cargo lifting equipment should be load tested every five years and thoroughly examined by a competent person annually. Other lifting equipment is not regulated except as usually required by class, but should be tested and examined under a similar regime. The minimum SWL for which testing is required is one tonne (1,000 kgs).

A Chain Register is not required, but there must be documentation supporting test and examination.

8.124 Are winches associated with lifting equipment in a satisfactory condition?

Note: Cargo derrick topping lifts should have a means of securing them, such as a locking pin or ratchet, to prevent the weight of the derrick being solely taken by the winch brake. Check that this is fitted and that it and any associated winches are in good condition.

LNG carrier supplement

Note: Questions 128 - 130 apply to LNG carriers and should be completed in addition to the other questions in this chapter.

8.125 Is the gas detection system for the boiler room in good order?

8.126 Is the gas fuel piping protection in good order?

Gas fuel piping should not pass through accommodation spaces, service spaces, or control stations. Gas fuel piping may pass through or extend into other spaces provided they fulfil one of the following:

- The gas fuel piping should be a double-wall piping system with the gas fuel contained in the inner pipe. The space between the concentric pipes should be pressurised with inert gas at a pressure greater than the gas fuel pressure. Suitable alarms should be provided to indicate a loss of inert gas pressure between the pipes; or
- The gas fuel piping should be installed within a ventilated pipe or duct. The air space between the gas fuel piping and inner wall of this pipe or duct should be equipped with mechanical exhaust ventilation having a capacity of 30 changes per hour. The ventilation system should be arranged to maintain a pressure less than the atmospheric pressure. Continuous gas detection should be provided to indicate leaks and to shut down the gas fuel supply to the machinery space.

(IGC 16.3.1)

8.127 Is the automatic gas shut-off system in good order and regularly tested?

Each gas utilisation unit should be provided with a set of three automatic valves. Two of these valves should be in series in the gas fuel pipe to the consuming equipment. The third valve should be in a pipe that vents, to a safe location in the open air, that portion of the gas fuel piping that is between the two

valves in series. These valves should be arranged so that failure of the necessary forced draft, loss of flame on boiler burners, abnormal pressure in the gas fuel supply line, or failure of the valve control actuating medium will cause the two gas fuel valves which are in series to close automatically and the vent valve to open automatically. (IGC 16.3.6)

Ship to ship transfer operations supplement - gas

If the vessel is equipped with specialised equipment for regular ship to ship transfer operations such as fenders and hoses, the fact should be recorded.

This supplement should be completed only for vessels which carry out ship to ship transfer operations in open water and it does not apply to vessels which only occasionally carry out such operations within port confines.

8.128 Are operator's procedures provided for ship to ship operations?

Procedures should follow the recommendations of the OCIMF/ICS STS Transfer Guide (Liquefied Gases).

8.129 Have senior deck officers had open-water ship to ship transfer experience within the last 12 months?

8.130 Are sufficient closed fairleads and mooring bitts provided?

It is recommended that all fairleads used during STS transfer operations are of an enclosed type. Such fairleads should be strong enough to take the anticipated mooring loads and large enough to allow the mooring line (plus any soft rope and tackle) to pass through comfortably. (STS Guide 10.3.4)

It has been found that enclosed fairleads and bitts for spring lines need to be positioned no more than 35 metres forward and aft of the cargo manifold. (STS Guide 10.3.4)

It is recommended that all tankers be fitted with an array of mooring bitts of sufficient strength on each side of the ship. (STS Guide 10.3.5)

8.131 Are ship-to-ship transfer checklists completed?

The checklists should be used not only at the time of transfer but also when organisers are planning an operation. Adherence to check list procedures will ensure that the most essential aspects of an operation are covered. The checklists are:

- 1 - Pre-fixture information;
- 2 - Before operations commence;
- 3 - Before run-in and mooring;
- 4 - Before cargo transfer; and
- 5 - Before unmooring.

(STS Guide 3.2 and Appendix 1)

8.132 If a ship-to-ship transfer was in progress during the inspection, was it conducted in accordance with the recommendations of the OCIMF/ICS STS Transfer Guide (Liquefied Gases)?

Additional comments:

If the Inspector has comments in respect of the subject matter covered by the Chapter additional to those which the Inspector may make in response to the specific key questions in the Chapter, the Inspector should include such additional comments in this section.

Chapter 9. Mooring

Notes: The OCIMF publications 'Effective Mooring', 'Mooring Equipment Guidelines' and 'Guidelines on the Use of High Modulus Synthetic Fibre Ropes as Mooring Lines on Large Tankers' provide information on all aspects of mooring equipment and operations.

Common causes of accidents are an inadequate understanding of good mooring practices, unattended mooring lines, a mixture of wire and non-wire moorings, unbalanced mooring arrangements, poor quality of mooring lines, poor maintenance of mooring equipment, insufficient knowledge of local conditions, inattention to weather and tidal conditions and passing traffic.

Mooring equipment documentation:

9.1 Are certificates available for all mooring ropes and wires?

Note: A file showing the locations of the winches should be maintained. Test certificates for mooring lines, Mandel/Tonsberg shackles and synthetic tails should clearly show to which winch each particular component has been fitted.

9.2 Do all mooring ropes and where fitted, mooring wire tails, meet OCIMF guidelines?

Notes: Modern polypropylene mixture ropes contain a proportion of synthetic fibres such as polyester and they have superior qualities to the traditional polypropylene rope.

High-modulus synthetic ropes provide an alternative to conventional synthetic ropes and wires. There are two types of high-modulus rope - Aramid and HMPE (high-modulus polyethylene). The OCIMF publication 'Guidelines on the use of high-modulus synthetic fibre ropes' compares the characteristics of wires and various synthetic ropes against high modulus ropes.

Polypropylene rope has approximately the same elasticity as polyester rope, but is significantly weaker than either polyester or nylon. The use of polypropylene ropes for moorings is not recommended. (MEG 6.3.1.3)

If used, tails should be made of a material with a high breaking strength such as braided or plaited nylon, or high modulus synthetic fibre rope. The size of rope selected should be capable of easy handling, while at the same time being of sufficient quality to ensure that the tail has a dry breaking strength at least 25% greater than the associated wire. (MEG 6.2.7)

Dry nylon rope is slightly stronger than polyester, but wet nylon loses strength much faster under cyclic loading than polyester and for this reason nylon tails should have at least 37% more strength than the associated wire to allow for the reduction in wet strength. (MEG 6.3.1.2)

Tails should be replaced at least every 18 months unless experience and/or inspection indicate a shorter or longer period is warranted. (MEG 6.2.7)

9.3 If one or more bow stoppers are fitted, is there a certificate attesting to the safe working load?

9.4 Are there records of the inspection and maintenance of mooring ropes, wires and equipment?

Note: Records should include:

- *Individually identified and tagged mooring lines to allow them to be traced;*
- *A log of where they are deployed;*
- *Records of regular inspections;*
- *Records of maintenance.*

9.5 Is there a policy in place for the testing of winch brakes and are the results recorded?

Mooring winch brake design capacity is the percentage of the minimum breaking load of a new mooring rope or wire it carries, at which the winch brake is designed to render. Winch brakes will normally be designed to hold 80% of the line's minimum breaking load and will be set in service to hold 60% of the mooring line's minimum breaking load. Brake holding capacity may be expressed either in tonnes or as a percentage of a line's minimum breaking load.

The primary brake should be set to hold 60% of the mooring line's minimum breaking load. Since brakes may deteriorate in service, it is recommended that new equipment be designed to hold 80% of the line's minimum breaking load, but have the capability to be adjusted down to 60%. (MEG 7.5.6)

Ideally, a brake should hold and render within a very small range and once it renders, should shed only enough load to bring the line tension back to a safe level. Unfortunately, the widely used band brake with screw is only marginally satisfactory in fulfilling these requirements and its operation requires special care.

(MEG 7.5)

Specifications should be available on the winch drum to show the design holding capacity and the torque required on the hand wheel or lever to achieve this.

(MEG 1.8)

Notes: It is important that where self-storing winches are fitted there is awareness of the need to monitor the brake holding capacity to ensure that mooring winch brakes will render well before ropes reach their minimum breaking load and part.

If mooring lines are utilised that have a minimum breaking load in excess of that for which the winch was originally designed, the brakes should be set to render at 60% of the minimum breaking load of the mooring line for which the winch was designed. A further consideration in such cases is that if the over-strength line is of a greater diameter than the mooring line for which the winch was designed, full stowage on the drum must be made and in the case of split-drum winches, must not result in excess layers on the tension part of the drum when in use.

Mooring procedures:

9.6 Are moorings satisfactorily deployed and tended?

Generally mooring lines of the same size and type (material) should be used for all leads. Mooring lines should be arranged so that all lines in the same service are about the same length between the ship and the shore bollard.

(MEG 1.5)

Note: The mooring arrangement in use for the port and its effectiveness should be reviewed. Breastlines provide the bulk of transverse restraint, backsprings the longitudinal. Headlines and sternlines contribute much less to the mooring strength than is commonly supposed.

9.7 Are mooring lines secured to bitts and turned up correctly?

The recommended method of turning a rope up on bitts is to take one or two full turns around the leading post before 'figure-of-eighting'. The reason for this is to reduce the tendency to pull the two posts together.

(MEG 8.2)

Note: Mooring lines must not be secured to winch warping drums.

9.8 Are all powered mooring lines correctly reeled on drums?

A band brake is designed to work in one direction only. Therefore the line must always be reeled correctly on the drum. The line is properly reeled if it is pulling against the fixed end of the brake strap. Disc brakes work equally well in either direction.

(MEG 7.5.2.6)

9.9 Are all powered mooring lines secured on brakes and are the winches out of gear?

9.10 On split drum winches are all the lines made fast with no more than one layer on each tension side of the drum?

More than one layer increases the effective lever and reduces the brake holding capacity.

(MEG 7.5.1)

9.11 If mooring tails are fitted to wires, do they have proper connecting links and are they correctly fitted?

Note: Connecting links are usually either Tonsberg, Mandal or Boss shackles. Tonsberg have a straight pin and the tail should be connected to it; Mandal has a curved roller and the wire should be connected to it; Boss shackles are available in both versions and the same rules apply.

9.12 Are all mooring lines stowed neatly to minimise tripping hazards and are mooring areas clear and unobstructed?

Mooring equipment:

9.13 Are mooring winches in good order?

9.14 Do mooring winch foundations appear to be in a satisfactory condition?

9.15 Do brake linings, drums and pins appear to be in good order?

Notes: Defective brake gear is often evident, particularly on older vessels. Check the condition of cheek plates for wastage and distortion, the hinge pins and their retaining devices and the condition of the brake drum below the lining.

If there is significant wear on the brake linings, the brake adjustment screw may be at the limit of its travel and further tightening not possible.

9.16 If mooring winches in a gas hazardous area are electrically powered, are motors Ex 'd' rated?

Notes: Most mooring winches will be outside gas hazardous areas and therefore will not require an 'Ex' rating. If not, there must be evidence available, either by a manufacturer's plate on the motor, or by documentation, that the motor is rated for use in a gas-hazardous area. An Ex 'd' rating means that the equipment can withstand an internal explosion without igniting the outside atmosphere. Ex 'e' is an increased safety rating.

Glands at the point of entry of electric cables into junction boxes should be checked.

9.17 If mooring winches are electrically powered, are insulation tests carried out and the results recorded?

Note: Records should be available of the testing of the insulation resistance, from the phases to earth, of motors. The resistance should be above 1 Megohm. Falling insulation resistance indicates deterioration.

9.18 If mooring winches are steam powered, are steam chests and the brackets connecting them to the winches in a satisfactory condition and are they free of wastage or temporary repairs?

9.19 Are mooring wires, ropes and synthetic tails in good order?

Notes: Splicing of ropes is acceptable, but reduces the strength of the rope by about 10%. Splices in eyes and for repairs should have a minimum of 5 tucks.

Particular attention should be paid to the eyes of mooring wires. If there are more than three broken wires in any strand, or five in any adjacent strands in a length of wire 10 times the diameter, the damaged part requires removal and the wire re-splicing.

There should be a routine for the maintenance of wires and the lubrication of them using a preservative which will effectively penetrate the strands and wires.

9.20 Are pedestal fairleads, roller fairleads and other rollers well greased and free to turn and are bitts and chocks free of grooving?

9.21 Is mooring equipment marked with its SWL?

Each mooring fitting, including bitts, bollards, chocks, pedestal rollers, closed chocks, universal roller leads, chain stoppers and mooring winches must be clearly marked with its SWL by weld bead outline. (MEG 4.6)

Anchoring equipment:

9.22 Are windlasses, anchors, locking bars and cables in a satisfactory condition and operating effectively?

Note: The condition of the locking bars should be checked to ascertain that they function correctly by locking the chain when the vessel is at anchor to prevent the brake having to take the full load of the cable.

9.23 Except whilst alongside, when locking bars should be in place, were the anchors cleared and ready for immediate use during port entry?

Whilst moored alongside, anchors not in use should be properly secured by brake and guillotine, but otherwise be available for immediate use.

9.24 Are bitter end securing arrangements unobstructed and outside the chain locker?

9.25 Are the chain locker doors securely battened down?

Single point moorings:

9.26 Is single point mooring (SPM) and associated equipment fitted to OCIMF recommendations?

Ships likely to trade to SPM's should be equipped with bow chain stoppers designed to accept 76 mm chafe chain:

<i>Up to 150,000 tdw:</i>	<i>1 stopper</i>	<i>200 tonnes swl</i>
<i>150 to 350,000 tdw:</i>	<i>2 stoppers</i>	<i>200 tonnes swl</i>
<i>Over 350,000 tdw:</i>	<i>2 stoppers</i>	<i>250 tonnes swl</i>

Stoppers should be located between 2.7 and 3.7 metres inboard from the bow fairlead (regardless of the size of vessel) and due consideration should be given to the correct alignment of stoppers relative to the lead between bow fairlead, stopper, pedestal fairlead and winch drum or the warping drum of the winch.

A bow fairlead should measure at least 600 by 450 mm and be placed on the centre line. Two fairleads are recommended for ships over 150,000 tonnes dwt., which should be spaced 2 metres centre to centre apart, but in no case more than 3 metres. (MEG Appendix A)

- 9.27 If the vessel is equipped for mooring at single point moorings, can the pick-up hawser be led to a winch storage drum rather than the warping drum end and without the use of one or more pedestal fairleads involving an acute angle of lead?**

If the arrangement requires use of more than one pedestal roller to lead the hawser to the winch storage drum, comment as to the arrangement provided.

Notes: Many SBM terminal operators require a direct, or nearly direct lead from the bow fairlead through the bow stopper and either directly to a winch storage drum or round a single pedestal fairlead at a shallow angle to a winch storage drum.

If a pedestal fairlead is utilised, it should be located not less than 4.5 metres aft of the aft side of the bow stopper regardless of the size of the vessel and provide a direct, or nearly direct, lead to the storage drum. Use of more than one pedestal fairlead, or if the angle of the lead is excessive, may cause excess loading being applied to the pedestal fairlead and result in serious damage to the pedestal or its foundations.

If a winch storage drum is used to stow the pick-up rope, it should be of sufficient size to accommodate 150 metres of 80 mm diameter rope. (MEG Appendix A)

- 9.28 If the vessel is fitted with a hydraulically operated bow stopper, are safeguards provided to prevent its accidental release?**

Emergency towing arrangements:

- 9.29 Are emergency towing arrangements readily available for deployment forward and aft?**

The requirement for emergency towing arrangements applies to oil, chemical and gas tankers over 20,000 tdw.

For tankers constructed on or after 1st July 2002:

- The arrangements shall, at all times, be capable of rapid deployment in the absence of main power on the ship to be towed and easy connection to the towing ship. At least one of the emergency towing arrangements shall be pre-rigged ready for rapid deployment; and,*
- Emergency towing arrangements at both ends shall be of adequate strength taking into account the size and deadweight of the ship and the expected forces during bad weather conditions.*

(SOLAS II-1/3-4)

For tankers constructed before 1 July 2002:

- The design and construction of emergency towing arrangements shall be approved by the administration, based on the guidelines developed by the Organisation (MSC.35);*
- The aft emergency towing arrangement should be pre-rigged and capable of being deployed in a controlled manner in harbour conditions by one person within 15 minutes;*
- The pick-up gear for the aft towing pennant should be designed at least for manual operation by one person taking into account the absence of power and the potential for adverse environmental conditions that may prevail during such emergency towing operations. The pick-up gear should be protected against the weather and other adverse conditions that may prevail;*
- The forward emergency towing arrangement should be capable of being deployed in harbour conditions in not more than one hour. (It is unlikely that a length of chain could be retrieved within the time limit if it is stored in the foc's'le space);*
- Forward emergency towing arrangements which comply with the requirements for aft emergency towing arrangements may be accepted;*
- All emergency towing arrangements should be clearly marked to facilitate safe and effective use even in darkness and poor visibility;*
- All emergency towing components should be inspected by ship personnel at regular intervals and maintained in good working order.*

(MSC.35)

Note: Once the system has been deployed the watertight integrity of adjacent spaces should be maintained. The prime emergency towing arrangement may be fitted either forward or aft.

Emergency towing-off pendants:

9.30 Are the emergency towing-off wires (fire wires) in a satisfactory condition?

9.31 Are the fire wires of appropriate size and do they conform to OCIMF recommendations?

Fire wires should be steel wire lines of 6 x 36 construction and be made of the same type of steel as that recommended for standard mooring wires. The use of synthetic or natural fibre ropes is not permitted as these would burn in the event of a fire. (MEG 3.11)

Note: The recommended sizes of fire wires are as detailed below, but this information is provided for guidance only and is not intended to indicate a uniform standard:

<i>Less than 20,000 dwt:</i>	<i>30 tonnes MBL, 25 metres in length;</i>
<i>20,000 – 100,000 dwt:</i>	<i>50 tonnes MBL, 45 metres in length;</i>
<i>100,000 – 300,000 dwt:</i>	<i>90 tonnes MBL, 60 metres in length;</i>
<i>300,000 + dwt:</i>	<i>110 tonnes MBL, 70 metres in length.</i>

9.32 Are the emergency towing-off wires properly rigged to meet terminal requirements?

Fire wires can be rigged either with or without slack on deck and the vessel should be guided by the terminal requirements. The eye of the fire wire should be maintained between the water line and two metres above it. (MEG 3.11)

Note: Fire wires should always be rigged with sufficient slack available to allow a tug to safely connect the wire to its towing hook. The recommended method is to avoid slack on deck and to hang a bight over the side and adjust the height by means of a heaving line attached to the eye and led back to the deck. However, the vessel should be guided by the terminal requirements where these differ.

Additional comments:

If the Inspector has comments in respect of the subject matter covered by the Chapter additional to those which the Inspector may make in response to the specific key questions in the Chapter, the Inspector should include such additional comments in this section.

Chapter 10 Communications

Satellite communications equipment normally operates at 1.6 GHz and the power levels generated are not sufficient to present an ignition hazard. Satellite communications equipment may therefore be used to transmit and receive messages whilst the ship is in port.

Communications procedures:

- 10.1 Are instructions for operating the digital selective calling (DSC) and satellite communications equipment in an emergency clearly displayed?**
- 10.2 Are the vessel's call sign and Inmarsat ship station identity clearly marked on the radio installation?**
- 10.3 Can officers demonstrate a satisfactory understanding of how to operate the equipment in an emergency?**
- 10.4 Is a continuous listening watch maintained on VHF channel 16?**
Note: This requirement is to be reassessed in 2005.
- 10.5 Are officers aware of the requirements for position updating on two-way communications equipment?**
All two-way communication equipment which is capable of automatically including the ship's position in the distress alert shall be automatically provided with this information from an internal or external navigation receiver, if either is installed. (SOLAS IV/18)
If such a receiver is not installed, the ship's position and the time at which it was determined shall be manually updated at intervals not exceeding four hours, while the ship is underway, so that it is always ready for transmission by the equipment. (SOLAS IV/18)
- 10.6 Are officers aware of the function of the ship security alert system and how it operates?**
Under no circumstances should enquiries be made as to the system details.
All ships constructed after 1st July 2004 shall be fitted with a ship security alert system. (SOLAS XI-2/6.1.1)
All oil tankers, chemical tankers, gas carriers and bulk carriers constructed before 1st July 2004 shall be fitted with such a system not later than the first survey of the radio installation after 1st July 2004. (SOLAS XI-2/6.1.3)
The ship security alert system shall, when activated, initiate and transmit a ship-to-shore security alert to a competent authority, which in these circumstances may include the operator, identifying the ship, its location and indicating that the security of the ship is under threat or it has been compromised. (SOLAS XI-2/6.2.1)
It shall not send the security alert to other ships or raise the alarm on board and it shall continue until deactivated or reset. (SOLAS XI-2/6.2.2,3 and 4)
The ship security alert system shall be capable of being activated from the navigation bridge and in at least one other location. (SOLAS XI-2/6.3.1)
- 10.7 Has a qualified person been designated to handle distress communications?**
A qualified person shall be designated to have primary responsibility for radio communications during distress incidents. (SOLAS IV/16.1)
Note: That person should not be the master.
- 10.8 Are the periodical tests of communications equipment being carried out as required?**
The following tests should be carried out:
- Daily:*
- *The proper functioning of the DSC facilities without radiation of signals;*
 - *Battery voltage checks;*
 - *Printers.*
- Weekly:*
- *The proper function of the DSC facilities by means of a test call when within communication range of a coast station;*

- Where the reserve source of energy is not batteries, the reserve source to be tested.

Monthly:

- Each Emergency Position Indicating Radio Beacon (EPIRB) to be tested to determine its capability to operate properly using the means provided on the device and without using the satellite system;
- Each marine search and rescue transponder (SART) using the in-built test facility and checked for security and signs of damage;
- The security and condition of all batteries providing a source of energy for any part of the radio installation;
- The condition of all aerials and insulators;
- Each survival craft two-way VHF equipment, on a frequency other than channel 16.

(MSA Radio Log)

10.9 Is the Radio Log being maintained correctly?

The following should be being recorded:

- A summary of distress, urgency and safety communications;
- Important incidents relating to the radio service;
- Where appropriate, the position of the ship at least once per day;
- A summary of the condition of the radio equipment, including its sources of energy;
- Personnel assigned responsibility for sending a distress alert instructed to operate properly all radio equipment on the ship;
- Necessary instruction and information on the use of the radio equipment to relevant crew members;
- Pre-sailing checks to ensure that all equipment is in an efficient working condition;
- The results of the testing of the DSC distress and safety radio equipment by means of a test call at least once a week;
- The results of the testing of the distress and safety radio equipment by means of a test at least once each day but without radiating any signal;
- The on-load and off-load daily test of the batteries;
- The results of the weekly hydrometer or load test of the batteries;
- The results of the monthly security check of each battery and its connections. (MSA Radio Log)

10.10 If applicable, is the emergency radio battery log up to date?

Where a reserve source of energy consists of rechargeable accumulator batteries, their capacity shall be checked, using an appropriate method, at intervals not exceeding 12 months, when the ship is not at sea.

(SOLAS IV/13.6)

10.11 Is there a maintenance programme in place to ensure availability of the radio equipment?

On ships engaged on voyages in sea areas A1 and A2, the radio availability shall be ensured by using such methods as:

- Duplication of equipment; or
- Shore based maintenance (the requirement on GMDSS vessels to have shore based maintenance does not infer there should necessarily be a contract but that maintenance should be carried out annually by a shore-based i.e. 'expert' organisation); or
- At-sea electronic maintenance capability; or
- A combination of these as may be approved by the administration. (SOLAS IV/15.6)

On ships engaged on voyages in sea areas A3 and A4, the radio availability shall be ensured by using a combination of at least two of the methods detailed above. (SOLAS IV/15.7)

Communications equipment:

10.12 Is the communications equipment in good order?

Note: The minimum requirements for radio equipment for the vessel should be taken from the Radio Certificate and its attachment Form R.

10.13 Is the satellite EPIRB fitted, armed and labelled correctly and inspected in accordance with the manufacturer's requirements?

The EPIRB shall be:

- Installed in an easily accessible position;
- Ready to be manually released and capable of being carried by one person into a survival craft;
- Capable of floating free if the ship sinks and of being automatically activated when afloat; and
- Capable of being activated manually. (SOLAS IV/7.1.6)

Satellite EPIRB's shall be tested at intervals not exceeding 12 months for all aspects of operational efficiency with particular emphasis on frequency stability, signal strength and coding. However, in cases where it appears proper and reasonable, the administration may extend this period to 17 months. The test may be conducted on board the ship or at an approved testing or servicing station. (SOLAS IV/15.9)

Notes: The vessel's name, the serial number and the maritime mobile services identity (MMSI or 15 Hex ID) should be clearly indicated on the EPIRB.

The inspection of EPIRB's should include:

- *Inspection of the housing to ensure it is undamaged;*
- *Inspection of the hydrostatic release unit to ensure it is in good order and in date. Releases should be renewed after two years;*
- *Inspection of the lanyard, which should be neatly stowed and not attached to the ship;*
- *Ensuring that the markings remain clearly decipherable;*
- *Checking the battery to ensure it is in good order and in date. The battery life for most EPIRB's is 5 years;*
- *Carrying out a self test. Most EPIRB's have a self test facility which is usually a spring-loaded switch. When activated a light will indicate that the test circuits are operating correctly and sometimes this will also activate the strobe light. It is recommended that the self test switch be held for no more than 2 flashes of the strobe light, or no longer than 1 minute after the first self-test mode burst transmission.*

When the self-test is activated on a 406 Mhz EPIRB, the EPIRB is allowed to radiate a single burst which is specially coded so that it is ignored by the COSPAS-SARSAT system. The EPIRB must never be tested by actual operation.

The annual testing of 406 MHz satellite EPIRB's required by SOLAS IV/15.9 requires test equipment capable of performing all the relevant measurements detailed in MSC/Circ 1040.

10.14 Are radio emergency batteries in a satisfactory condition and fully charged?

10.15 Are Lists of Radio Signals the latest edition and corrected up to date?

10.16 Is the vessel equipped with sufficient intrinsically safe portable radios for use on deck?

Note: Sufficient portable radios should be available to allow communications between the cargo control, the deck officer, the deck watch and the master, as well as the pumpman if required.

Additional comments:

If the Inspector has comments in respect of the subject matter covered by the Chapter additional to those which the Inspector may make in response to the specific key questions in the Chapter, the Inspector should include such additional comments in this section.

Chapter 11 Engine and steering compartments

Policies, procedures and documentation:

11.1 Is the vessel provided with adequate operator's instructions and procedures?

Note: Engineering procedures should include at least the following:

- *Engine room organisation and operation;*
- *Unmanned machinery space (UMS) operation, when applicable;*
- *Reporting equipment deficiencies;*
- *Engine room emergency preparedness and actions in the event of an emergency;*
- *Ensuring that all essential engine room equipment is available and fully operational;*
- *Planned maintenance;*
- *The control of spare parts.*

11.2 Are the duties of the watch-standing officers and ratings clearly defined?

11.3 If the machinery space is certified for unmanned operation is it being operated in that mode?

If the machinery space is certified for unmanned operation but is not being operated in that mode, record the reason why.

11.4 If the machinery space is being operated manned, are there sufficient engineers on board?

Note: If the machinery space is certified for unmanned operation, it will be likely that the Safe Manning Certificate will allow a reduced number of engineers to be carried. Ensure that the manning level, if operating manned, is not at that reduced level.

11.5 Has the chief engineer written his own standing orders and are night orders being completed?

Notes: Standing order and night order books should be checked to ascertain that all officers are instructed as to their responsibilities. Standing orders should be written by the chief engineer to reflect the specific operator's requirements, as well as his own, particular to the vessel, the trade and the experience of the engineering officers aboard at the time. It should be updated and signed by each chief engineer as they join the vessel.

Night orders should be written as and when they are required to supplement the standing orders.

11.6 Have the watch engineers countersigned the chief engineer's standing and night orders as read and understood?

11.7 Are there adequate procedures to prevent uncontrolled entry into the engine room?

Notes: Procedures should be in place to ensure that no-one enters the engine compartment alone, for example to carry out final evening checks during unattended periods, without first informing the bridge. Contact should be maintained at predetermined periods.

Ratings should not be required to attend the engine room alone during unattended periods.

On vessels where a single engineer maintains a watch, there should be procedures as detailed above to regularly and frequently maintain contact with the bridge or cargo control room, unless a dead man alarm system is fitted.

11.8 Is the dead man alarm system, where fitted, in good order and used as required?

Note: Dead man alarm systems should be set to activate at intervals not exceeding 15 minutes.

11.9 Is the engine room log book adequately maintained?

11.10 Is there a procedure to restart critical equipment?

Note: A written procedure should be readily available within the engine room which should be specific to the particular ship in order to identify relevant controls. The procedure should include the following guidance, where applicable, on how to:

- *Regain power from the emergency to the main switchboard;*
- *Charge the air receivers for the main diesel generators in order to provide electrical power to all auxiliaries (fuel and lubricating oil pumps and the boiler supply);*
- *Restart all auxiliaries;*

- Restart the main engine and boiler.

11.11 Does the operator subscribe to a fuel, lubricating and hydraulic oil testing programme?

11.12 Are detailed bunker transfer instructions available?

Notes: All bunkering operations should be carefully planned and executed. Pollution caused when heavy fuel oil is spilt is particularly damaging and difficult to clean up.

Personnel involved in the bunkering operation onboard should have no other tasks and should remain at their workstations during topping off. This is particularly important when bunkers are being loaded concurrent with cargo operations, so that conflicts of interest for operational personnel are avoided.

Planning of bunkering operations should include the following:

- Determining that there is adequate space for the volume of bunkers to be loaded;
- Controls for the setting of bunker system valves;
- Determining loading rates for the start of loading, bulk loading and topping off;
- Arrangements of bunker tank ventilation;
- Internal tank overflow arrangements;
- Verification of gauging system operation and accuracy;
- Alarm settings on overfill alarm units;
- Communication with the terminal to establish when bunkering can be undertaken;
- Methods of managing the handling of bunkers which have or may have a H₂S content and testing procedures for determining the presence of hydrocarbon or H₂S vapours;
- Method of determining the temperature of the bunkers during loading;
- Communications procedure for the operation, including emergency stop;
- Changing over tanks during loading;
- Containment arrangements and cleanup equipment to be available;
- Manning requirement to execute the operation safely.

Ship's personnel should always be alert to the possible presence of H₂S in bunker fuel.

It is preferable that a diagram of the fuel oil transfer piping be attached to the plan.

Planned maintenance:

11.13 Is a planned maintenance system being followed and is it up to date?

If the planned maintenance system is not class approved, record the fact.

Notes: Responsible personnel should be able to demonstrate familiarity with the system.

The planned maintenance database should include:

- Details of whether maintenance is carried out according to running hours or calendar period, or if condition monitoring is used as a substitute;
- Details, referenced to equipment manufacturer's instructions or experience, of what maintenance is required;
- Historical data on maintenance and repair work which has been carried out;
- Spares which have been used.

Any proposed major repairs or overhauls should have a completion schedule, with spare parts verified as being on board or on order.

11.14 Is a comprehensive and up to date inventory of spare parts being maintained?

Safety management:

11.15 Is an engineer's call alarm fitted and is it in good order and tested regularly and the results recorded?

Note: Inspectors should consider testing this critical alarm. To do so if permitted alongside, request that a suitable test alarm be initiated which should sound on the bridge, in the duty engineer's quarters and in public rooms. If not answered within the specified period a back-up alarm system should be activated. A PA announcement prior to the test would be beneficial.

11.16 Are emergency escape routes clearly marked, unobstructed and adequately lit?

11.17 Is the level of lighting in all areas of the engine room satisfactory?

11.18 Do records indicate the regular testing of emergency equipment?

Notes: Emergency equipment will include, where fitted, the emergency fire pump, main fire and foam pumps, emergency air compressor, emergency generator, emergency generator switchboard, emergency steering, quick closing valves, emergency stops, engineers alarms and bilge ejectors.

Testing of the emergency generator should be carried out under load, but to do this may require the vessel to be blacked out. Establish that the operator has a requirement for this test and determine from records whether they are carried out at least annually.

Where fitted, the emergency air compressor should be regularly tested to the starting pressure of the diesel generator. The emergency air reservoir should be permanently maintained at the required pressure.

11.19 Are engine room emergency stops and shut offs clearly marked and do records indicate that they have been regularly tested?

Note: Emergency stops include ventilation fans, fuel pumps and the quick closing valves for fuel and lubricating oil tanks.

11.20 Are diesel engine high and low pressure fuel delivery pipes adequately jacketed or screened?

External high pressure fuel delivery lines between the high pressure fuel pumps and fuel injectors shall be protected with a jacketed piping system capable of containing fuel from a high pressure line failure. A jacketed pipe incorporates an outer pipe into which the high pressure fuel pipe is placed, forming a permanent assembly. The jacketed piping system shall include a means for collection of leakages and arrangements shall be provided for an alarm to be given of a fuel line failure. (SOLAS II-2/4.2.2.5.2)

11.21 Are diesel engine exhausts and other hot surfaces in the vicinity of fuel, diesel, lubricating and hydraulic oil pipes protected against spray?

Surfaces with temperatures above 220°C which may be impinged as a result of a leak from an oil system failure shall be properly insulated. (SOLAS II-2/4.2.2.6.1)

Precautions shall be taken to prevent any oil that may escape under pressure from any pump, filter or heater from coming into contact with heated surfaces. (SOLAS II-2/4.2.2.6.2)

11.22 Are hot surfaces, particularly diesel engines, free of any evidence of fuel, diesel and lubricating oil?

Note: Lagging and insulation should be in good condition and free from oil.

If there is evidence of oil leakage or oil soaked lagging this must be recorded as an observation.

11.23 Are purifier rooms and fuel and lubricating oil handling areas ventilated and clean?

Note: A significant number of major incidents occur as a result of engine room fires. It is of particular importance that purifier rooms and oil handling areas are maintained in a clean condition.

11.24 Are main engine bearing temperature monitors, or the crankcase oil mist detector, in good order?

Internal combustion engines of 2,250 KW and above or having cylinders of more than 300 mm bore shall be provided with crankcase oil mist detectors, or engine bearing temperature monitors, or equivalent devices. (SOLAS II-1/47.2)

Note: Testing of the detector alarm can be carried out either electronically or by removing a cover and blocking the sensor path.

11.25 Where hydraulic aggregate pumps are located within the main engine compartment, is an oil mist detector fitted?

Note: In vessels fitted with deep-well pumps driven by hydraulic pressure packs, pressure in the transmission pipes can be very high. If the aggregate pumps are located within the engine compartment it is advisable that an oil mist detector be fitted.

11.26 Are the main switchboard, alternators and other electrical equipment satisfactorily protected from water spray?

If the main switchboard is not located in the engine control room or other protected location, record the measures that have been taken to protect it from water spray.

Note: Risk due to water spray in the event of failure of sea water pipes, including fire mains and hydrants, should be assessed.

- 11.27 **Is deck insulation provided to the front and rear of medium power (i.e. 220V and above) electrical switchboards and is it in a satisfactory condition?**
Where necessary non-conducting mats or gratings shall be provided at the front and rear of the switchboard. (SOLAS II-1/45. 2)
Non-conducting deck coverings, such as non-conducting mats or gratings, suitable for the specific switchboard voltage should be installed for personnel protection at the front and rear of the switchboard and should extend the entire length of and be of sufficient width to suit, the operating space. (Note: these USCG requirements apply to switchboards exceeding 250 volts). (USCG 46 CFR 111.30-11)
Note: Some decks will be made of insulating composite material and will not need extra insulation.
- 11.28 **Are gauge glass closing devices on oil tanks of a self-closing, fail-safe type and not inhibited?**
- 11.29 **Are self-closing sounding devices to double bottom tanks in good order and closed?**
- 11.30 **Is all moving machinery provided with effective guards where this presents a hazard?**
Note: Prudent judgement needs to be applied to determine where guards should be fitted.
- 11.31 **Do engine room machine tools have adequate eye protection available?**
- 11.32 **Are records maintained for the regular inspection and testing of lifting devices?**
Note: Lifting devices includes cranes, portable and beam chain blocks, pad eyes, lifting beams etc.
- 11.33 **Is an inspection and maintenance programme in place for other lifting equipment such as wire slings?**
- 11.34 **Is all loose gear in the machinery spaces, stores and steering compartment properly secured?**
- 11.35 **Are chemicals properly stowed and are Material Safety Data Sheets available?**
Note: Protective equipment including a face shield, apron, gloves and an eye-wash should be provided at the place where chemicals are stored.
- 11.36 **Are machinery spaces and steering compartments clean and free from obvious leaks and is the overall standard of housekeeping and fabric maintenance satisfactory?**
- 11.37 **Are bilges free of oil, rubbish and sediment?**
Note: Oily areas indicate a lack of adequate maintenance and cleanliness. However, a small amount of oil in savealls should not be considered unsatisfactory.
- 11.38 **Is the bilge high level alarm system regularly tested and are records maintained?**
Note: Inspectors should consider requesting that this critical alarm be tested in their presence. It should be borne in mind that most bilge alarms are fitted with time delays.
- 11.39 **Are seawater pumps, sea chests and associated pipework in a satisfactory condition and free of hard rust and temporary repairs, particularly outboard of the ship-side valves?**
Note: The condition of sea chests, sea water lines, storm valves and hull penetrations should be carefully checked to ensure that they are in good condition.
Any evidence of hard rust or deterioration should be reported as an observation.

Machinery status:

- 11.40 **Are the following, where applicable, all in good order and do they appear to be well maintained?**

The main engine;	
------------------	--

Auxiliary engines and generators, including a shaft and emergency generators where fitted;	<i>Notes: Consider examining log book entries to determine that any idle generators have been run recently. Check that the automatic switch over arrangements and protection devices such as reverse power relays are in good order and that engineers are familiar with procedures for changing over generators.</i>
Boilers, including waste heat and domestic boilers;	<i>Notes: Where fitted with automated boilers, they should be being operated in automatic mode. Boiler controls should not be overridden or by-passed.</i>
Compressors including main, instrument and emergency air compressors;	
Purifiers and fuel oil handling equipment;	
Inert gas plant, including the fans, scrubber, analyser and valves;	<i>Note: Records should confirm that tests of trips have been carried out.</i>
Sewage plant;	
Bilge pumping arrangements and the oily water separator;	
Pipework, including steam, fuel, lubricating oil, seawater, sewage, drain and air pipes, etc.	
Refrigeration and air conditioning machinery;	
Hydraulic aggregate pumps;	
Ventilation fans and trunking;	
Stern tube sealing arrangements;	
Any other items of machinery, including stand-by machinery.	

- 11.41 Is the engine side manoeuvring station in good order and are engineers familiar with the procedure for taking control from the bridge in an emergency?
Note: Procedures should be readily available for this method of operation.
- 11.42 Are concise starting instructions for the emergency generator clearly displayed?
Each emergency generating set arranged to be automatically started shall be equipped with starting devices approved by the administration with a stored energy capability of at least three consecutive starts. A second source of energy shall be provided for an additional three starts within 30 minutes unless manual starting can be demonstrated to be effective. (SOLAS II-1/44.2)
*Notes: These instructions are not for the use of the qualified engineering personnel, but for others who might be required to start the generator in an emergency.
Where the emergency generator starting source relies on a single starter motor, then a spare starter motor should be available.*
- 11.43 Is the emergency generator reserve fuel tank provided with sufficient fuel?
The generator should be capable of providing full load requirements for at least 18 hours. (SOLAS II-1/43.2)
*Notes: This may not necessarily mean a full tank. A minimum quantity to provide sufficient fuel for this requirement should have been established.
If necessary, the emergency generator fuel tank should be charged with fuel designed for use in sub-zero temperatures.
Every oil fuel pipe, which, if damaged, would allow oil to escape from a storage, settling or daily service tank situated above the double bottom, shall be fitted with a cock or valve directly on the tank capable of being closed from a safe position outside the space concerned in the event of a fire occurring in the space in which such tanks are situated. (SOLAS 74 II-2/15.2.5)
Oil fuel pipes, which if damaged would allow oil to escape from a storage, settling or daily service tank having a capacity of 500 litres and above situated above the double bottom, shall be fitted with a cock or*

117

valve directly on the tank capable of being closed from a safe position outside the space concerned in the event of a fire occurring in the space in which such the tanks are situated. (SOLAS 2004 II-2/4.2.2.3.4)
The controls for remote operation of the valve for the emergency generator fuel tank shall be in a separate location from the controls for remote operation of other valves for tanks located in machinery spaces. (SOLAS 2004 II-2/4.2.2.3.4)

11.44 Where an emergency generator is not fitted, are engine room emergency batteries in good order and fully charged?

Note: The emergency batteries must supply the designed power load for up to 18 hours.

11.45 Is all electrical equipment including junction boxes and cable runs in good order?

11.46 Are switchboards free of significant earth faults?

Note: Class rules require a minimum insulation resistance of 1 megohm (1 million ohms). Good practice suggests that a much higher standard, as near to infinity as possible, but not less than 5 megohms, should be aimed for.

Steering compartment:

11.47 Has the emergency steering gear been tested within the past three months and are the results recorded?

These drills shall include direct control within the steering compartment, the communications procedure with the navigation bridge and, where applicable, the operation of alternative power supplies. (SOLAS V/26.4)

11.48 Are emergency steering gear changeover procedures clearly displayed in the steering compartment and in the wheelhouse?

Simple operating instructions with a block diagram showing the change-over procedures for remote control systems and steering gear power units shall be permanently displayed on the navigation bridge and in the steering gear compartment. (SOLAS V/26.3.1)

11.49 Are officers familiar with operation of the steering gear in the emergency mode?

All ship's officers concerned with the operation and/or the maintenance of steering gear shall be familiar with the operation of the steering systems and with the procedures for changing from one system to another. (SOLAS V/26.3.2)

Note: The opportunity should be taken if possible to request that an officer demonstrates the operation of the emergency steering gear.

11.50 Is the steering gear emergency reserve tank fully charged?

A fixed storage tank shall be provided having sufficient capacity to recharge at least one power actuating system including the reservoir. (SOLAS II-1/29.12.3)

Note: This may not necessarily mean a full tank. A minimum level to comply with these requirements should have been established.

11.51 Are the arrangements for the provision of heading information adequate?

Ships with emergency steering positions shall at least be provided with a telephone or other means of communication for relaying heading information to such positions.

(SOLAS 1974 V/12(f) and SOLAS 2004 V/19.2.1.9)

In addition, ships of 500 gt and upwards constructed after 1st February 1992 shall be provided with arrangements for supplying visual compass readings to the emergency steering position.

(SOLAS 74 V/12(f) and SOLAS 2004 V/19.2.5.2)

11.52 Are communications with the bridge satisfactory?

11.53 Is the rudder angle indicator clearly visible at the emergency steering position?

11.54 Is access to steering gear unobstructed?

11.55 Is the steering compartment fitted with suitable handrails, gratings or other non-slip surfaces?

The steering gear compartment shall be provided with suitable arrangements to ensure working access to steering gear machinery and controls. These arrangements shall include handrails and gratings or other

non-slip surfaces to ensure suitable working conditions in the event of hydraulic fluid leakage. (This regulation applies to all vessels (petroleum, chemical and gas tankers) except those of less than 10,000 gt built before 1st July 1986). (SOLAS II-1/29.13.2)

Additional comments:

If the Inspector has comments in respect of the subject matter covered by the Chapter additional to those which the Inspector may make in response to the specific key questions in the Chapter, the Inspector should include such additional comments in this section.

Chapter 12. General appearance and condition

Brief comments are required regarding the condition and appearance of the hull, weather decks, superstructure and on the condition and cleanliness of the accommodation and living quarters including hygiene, cleanliness and sanitation facilities.

Note: Check that each area, including structure, pipework, fittings, ladders, catwalks, rails, etc. are in a satisfactory condition and that they are clean, painted and properly maintained.

Hull, superstructure and external weather decks:

12.1 Is the general condition, visual appearance and cleanliness of the hull satisfactory?

12.2 Is the hull free of oil staining, extensive coating breakdown or excessive marine growth?

Note: Oil Record Books should have entries that record details of any oil spills which involved pollution.

12.3 Are hull markings clearly indicated and correctly placed?

The ship's identification number shall be permanently marked:

- *In a visible place either on the stern of the ship or on either side of the hull, amidships port and starboard, above the deepest assigned load line or either side of the superstructure, port and starboard or on the front of the superstructure; and,*
- *In an easily accessible place either on one end of the transverse bulkheads of the machinery spaces, or on one of the hatchways or, in the case of tankers, in the pump room. (SOLAS XI-1/3.4)*

The permanent marking shall be plainly visible, clear of any other markings on the hull and shall be painted in a contrasting colour. (SOLAS XI-1/3.5.1)

The permanent marking referred to in paragraph 1 shall be not less than 200 mm in height. The permanent marking referred to in paragraph 2 shall be not less than 100 mm in height. The width of the marks shall be proportionate to the height. (SOLAS XI-1/3.5.2)

The requirement for the ship's identification number shall be complied with not later than the first scheduled dry-docking after 1st July 2004 for ships constructed before that date. (SOLAS XI-1/3)

Note: The following should also be clearly indicated, where applicable:

- *The vessel's name;*
- *Loadlines;*
- *Draft marks;*
- *Thruster warnings;*
- *Tug push points.*

12.4 Is the general condition, visual appearance and cleanliness of the weather decks satisfactory?

12.5 Do decks in working areas have clearly identified non-slip surfaces?

12.6 Is the general condition of service pipework satisfactory and is it free from significant corrosion and pitting and soft patches or other temporary repairs?

Notes: The following deck pipework, should be examined, particularly on the underside, for external indications of corrosion and for patching or accelerated wear caused by rope abrasion:

- *Hydraulic and pneumatic pipework;*
- *Fire mains and associated fittings;*
- *Deck steam lines;*
- *Compressed air lines;*
- *Tank cleaning lines.*

Pipe securing arrangements should be intact and permit free movement of the pipes as necessary.

12.7 Are pipe stands, clamps, supports and expansion arrangements satisfactory?

12.8 Are all deck openings, including watertight doors and portholes, in a satisfactory condition and capable of being properly secured?

120

12.9 Are fuel, ballast and other space vents and air pipes in a satisfactory condition and does visual evidence indicate regular maintenance?

Note: Vent heads should be regularly dismantled to prove that flame screens, where fitted are clean and in a satisfactory condition and that the closing device which prevents the ingress of water is also in good condition and operating correctly.

12.10 Are all vents and air pipes clearly marked to indicate the spaces they serve?

12.11 Is the general condition, visual appearance and cleanliness of the superstructure satisfactory?

Electrical equipment:

12.12 Is deck lighting adequate?

Note: The level of deck lighting should be adequate to allow:

- *The safe access to the various areas for watchkeepers;*
- *The safe use of mooring equipment;*
- *The monitoring of the deck area for spills and leakages;*
- *The monitoring of all deck areas and the adjacent surrounding areas to prevent unauthorised access.*

12.13 Is the general condition of electrical equipment, including conduits and wiring, satisfactory?

12.14 Are light fittings in gas-hazardous areas Ex 'd' rated and in a satisfactory condition?

Notes: Lights will be either explosion-proof or pressurised. The flame paths of explosion-proof lights should not be painted over. Fluorescent fittings will generally have flame paths at each end.

The manufacturer's or administration's certificate approving the fitting for use in gas-hazardous areas will be invalidated if the correct bolts for securing the cover, or the correct light bulb size, are not used.

Particular attention should be paid to the following:

- *Cracks in metal, cracked or broken glasses or failure of cement around cemented glasses in flameproof or explosion proof enclosures;*
- *Covers of flameproof enclosures to ensure that they are tight, that no bolts are missing, and that no gaskets are present between mating metal surfaces;*
- *Each connection to ensure that it is properly connected;*
- *Possible slackness of joints in conduit runs and fittings;*

Vent fan, cargo pump and cargo winch motors and lighting are likely to be found within gas-hazardous areas. An Ex 'd' rating means that the equipment can withstand an internal explosion without igniting the outside atmosphere. Ex 'e' is an increased safety rating.

Internal spaces:

12.15 Are internal spaces and storerooms clean, free from debris and tidy?

12.16 Is the forecastle space free of water?

Accommodation areas:

12.17 Is the accommodation clean and tidy?

12.18 Are alleyways free of obstructions and exits clearly marked?

12.19 Are public spaces, including smoke rooms, mess rooms, sanitary areas, food storerooms, food handling spaces, refrigerated spaces, galleys and pantries clean, tidy and in a hygienically satisfactory condition?

Notes: A frequent cause of fires is the accumulation of unburnt fuel or fatty deposits in galley ranges, within flue pipes and in the filter cowls of galley vents. Such areas require frequent inspection to ensure that they are maintained in a clean condition.

Oil and deep fat fryers should be fitted with thermostats to cut off the electrical power and so prevent accidental fires.

121

12.20 Are laundries free of accumulations of clothing that could constitute a fire hazard?

12.21 Is the level of accommodation lighting satisfactory?

12.22 Is the condition of electrical equipment in the accommodation satisfactory?

12.23 Are personnel alarms in refrigerated spaces in good order?

Additional comments:

If the Inspector has comments in respect of the subject matter covered by the Chapter additional to those which the Inspector may make in response to the specific key questions in the Chapter, the Inspector should include such additional comments in this section.
